

Clinical Medicine and Genomics

Bruce R. Korf, MD, PhD
Department of Genetics
University of Alabama at Birmingham
President, ACMG Foundation for
Genetic and Genomic Medicine

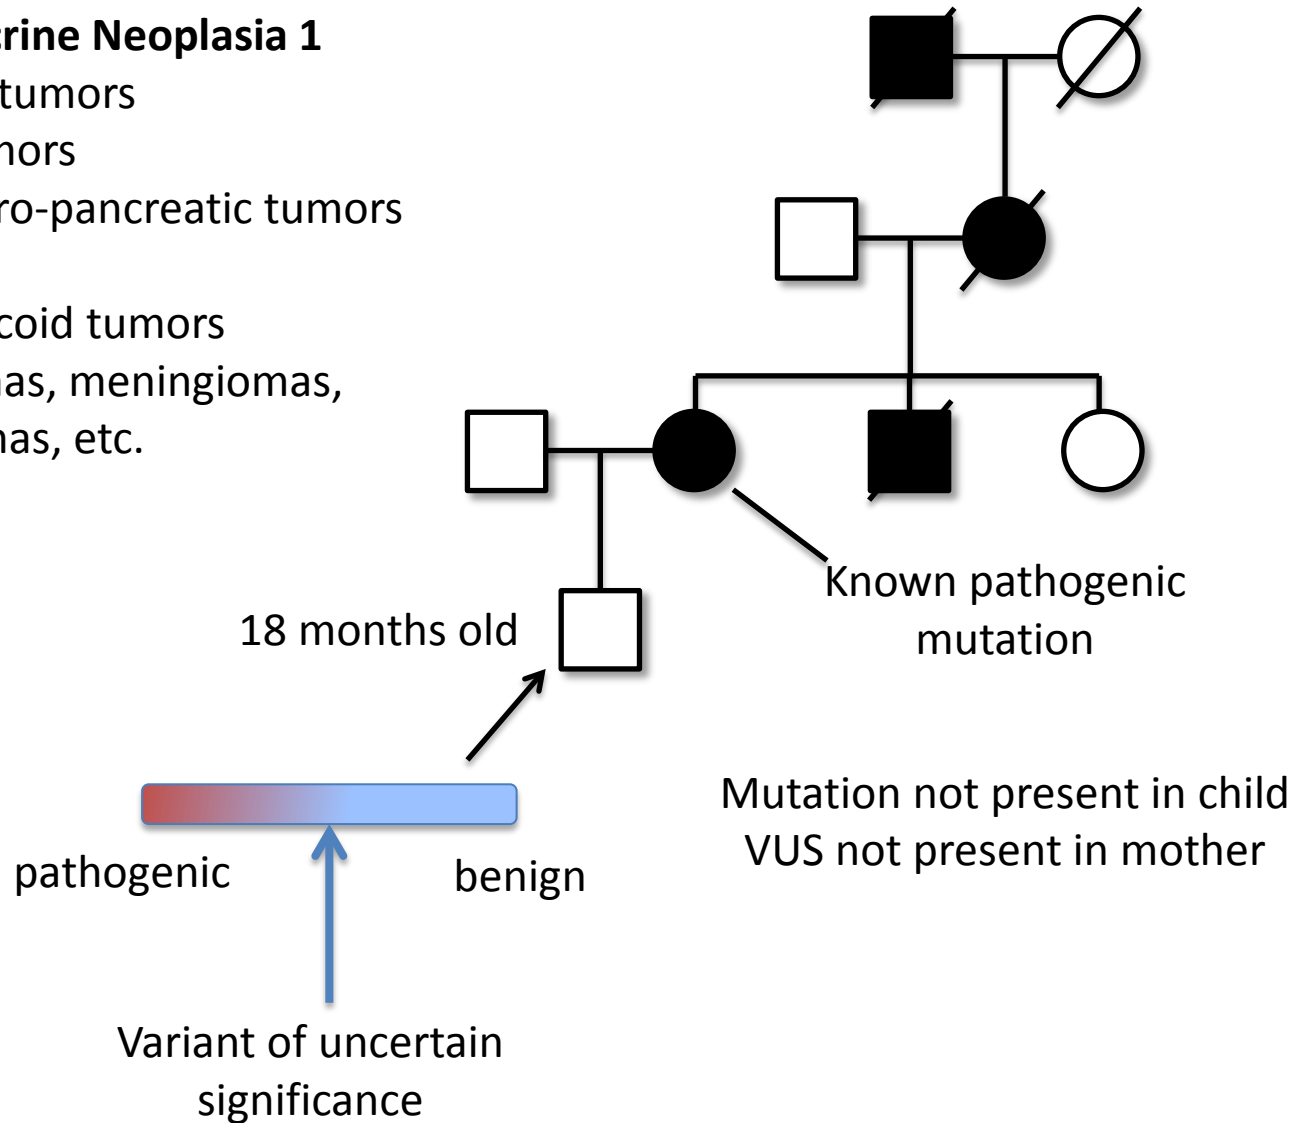

Evidence from the United States and abroad suggests inadequate genetics education of health care professionals as a significant factor limiting the integration of genetics into clinical care. Specific inadequacies include the amount and type of genetics content included in undergraduate professional school curricula and the small amount of genetics-related knowledge and skills of physicians, nurses, and other health professionals once they enter clinical practice. Modifications in medical, dental, nursing, public health, and pharmacy school curricula and in medical residency training programs are needed to ensure that health care professionals entering the workforce are well-trained in genetics.

Multiple Endocrine Neoplasia 1

- Parathyroid tumors
- Pituitary tumors
- Gastro-entero-pancreatic tumors
- Carcinoid
- Adrenocorticoid tumors
- Angiofibromas, meningiomas, ependymomas, etc.

Competencies

- Determine risk to child based on dominant inheritance of MEN1
- Recognize that child will benefit from diagnosis (? at 18 months)
- Order MEN1 genetic testing
- Appreciate significance of VUS
- Test affected relative first
- Formulate appropriate care plan

What are the necessary knowledge and skill sets required for analyzing, interpreting, and utilizing genomic information?

- Focus on competencies, not knowledge ...
 - ... point-of-care decision support tools may guide clinical use ...

- ... but a health provider should be able to explain why, not only what and how

Competencies

- Recognize indications for testing
- Select appropriate family member to test first
- Discuss issues of payment/risks/benefits
- Select a laboratory
- Interpret report – recognize limitations
- Genomic sequencing – recognize potential for secondary findings
- Refer to specialist as needed
- Discuss results with family

Newborn Screening

Newborn Screening ACT Sheet [Elevated C14:1 +/- other long-chain acylcarnitines] Very Long-Chain Acyl-CoA Dehydrogenase (VLCAD) Deficiency

Differential Diagnosis: Very long-chain acyl-CoA dehydrogenase (VLCAD) def.

Condition Description: VLCAD deficiency is a fatty acid oxidation (FAO) disorder. Fatty acid oxidation occurs during prolonged fasting and/or periods of increased energy demands (fever, stress) when energy production relies increasingly on fat metabolism. In a FAO disorder, fatty acids and potentially toxic derivatives accumulate because of a deficiency in one of the mitochondrial FAO enzymes.

MEDICAL EMERGENCY - TAKE THE FOLLOWING IMMEDIATE ACTIONS:

- Contact family to inform them of the newborn screening result and ascertain clinical status (poor feeding, vomiting, lethargy).
- Consult with pediatric metabolic specialist.
- Evaluate the newborn (poor feeding, lethargy, hypotonia, hepatomegaly, acylthiolsis, evidence of cardiac decompensation). If signs are present or infant is ill, initiate emergency treatment with IV glucose and oxygen. Transport to hospital for further treatment in consultation with metabolic specialist. If infant is normal initiate timely confirmatory/diagnostic testing, as recommended by specialist.
- Educate family about need for infant to avoid fasting. Even if mildly ill, immediate treatment with IV glucose is needed.
- Report findings to newborn screening program.

Diagnostic Evaluation: Plasma acylcarnitine profile may show increased C14:1 acylcarnitine (and lesser elevations of other long chain acylcarnitines). Diagnosis is confirmed in consultation with the metabolic specialist by mutation analysis of the VLCAD gene and additional biochemical genetic tests.

Clinical Expectations: VLCAD deficiency may present acutely in the neonate and is associated with high mortality unless treated promptly; milder variants exist. Features of severe VLCAD deficiency in infancy include hepatomegaly, cardiomyopathy and acylthiolsis, lethargy, hypoketotic hypoglycemia, and failure to thrive. Treatment is available.

What are the training needs for an individual and what is not being addressed?

- Need to establish a vector of competency
 - Attract students to careers
 - Health professional students should enter better prepared
 - Integrate genetics into health professional education and residency
 - MOC may present an opportunity

Medical Education

HHMI

Competency M3

Use the principles of genetic transmission, molecular biology of the human genome, and population genetics to infer and calculate risk of disease, to institute an action plan to mitigate this risk, to obtain and interpret family history and ancestry data, to order genetic tests, to guide therapeutic decision making, and to assess patient risk.

ACMG Competencies

Competency 6: Assess and participate in a clinical or translational research study or clinical trial involving patients with or at-risk for a genetic disorder.

Learning Objectives:

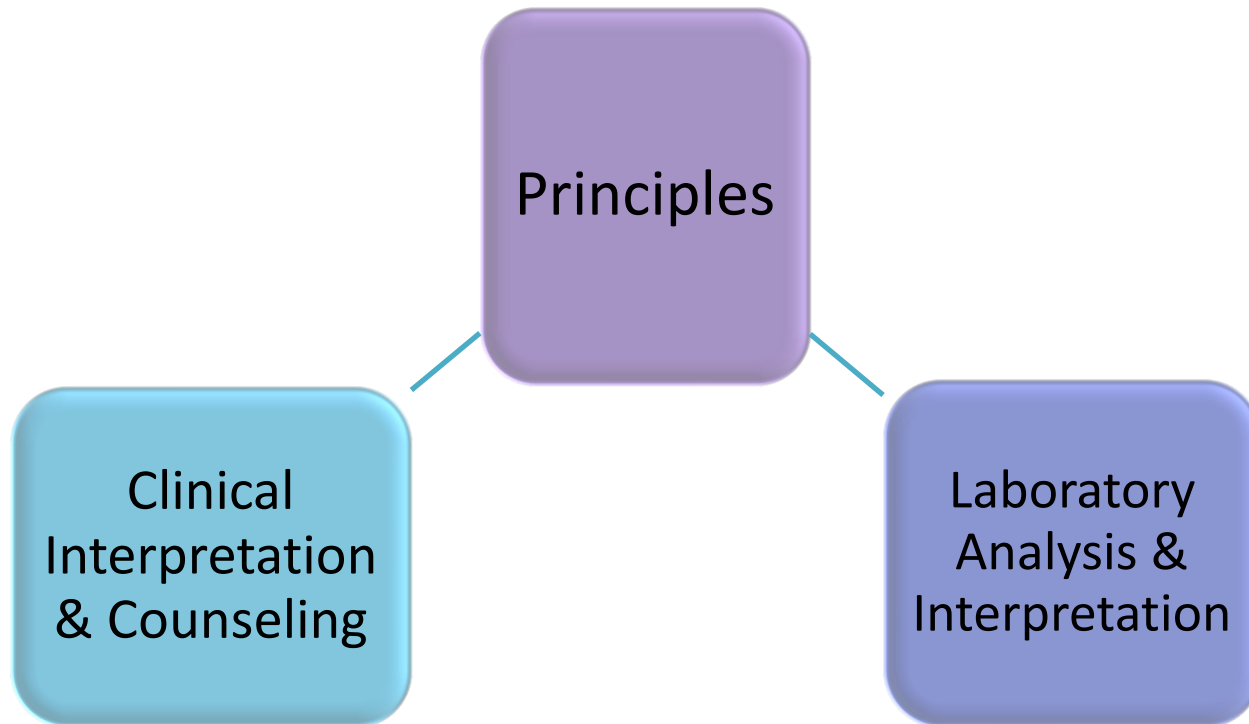

1. Critically evaluate protocols and/or publications reporting results of clinical research studies and clinical trials relevant to genetic disorders.
2. Achieve IRB certification to participate in research studies.
3. Appreciate the ethical issues that are associated with research studies, such as return of research results, identification of family members, and data, revelation of unexpected family findings that may be clinically significant.
4. Educate participants regarding risks and benefits of research studies and obtain informed consent and/or assent.

Competency 9: Provide counseling to individuals regarding the application of whole genome or whole exome sequencing.

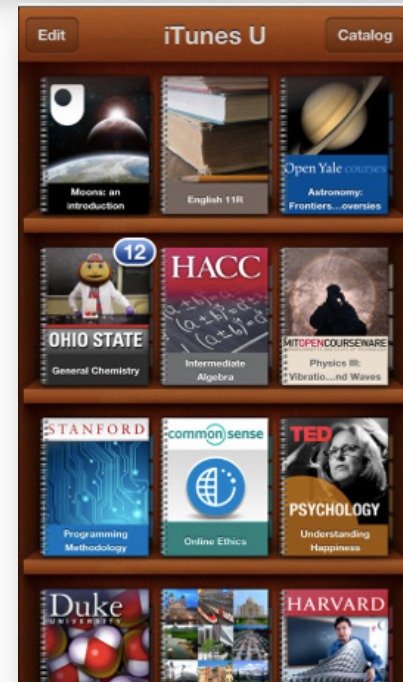

Learning Objectives:

1. Explain to an individual contemplating whole exome or genome analysis the potential risks, benefits and limitations of the information that will be obtained and facilitate informed decision-making.
2. Prioritize the information obtained from whole exome or genome analysis, including carrier status for recessive disorders, single gene disorders, pharmacogenetic traits, and alleles that confer risk of common disease, in providing feedback and counseling.
3. Describe potential risks and benefits that may be associated with disclosing risks of adult-onset disorders in children.
4. Utilize genomic databases and bioinformatics tools to filter results on genetic variants and assess their clinical significance.
5. Explain the difference between variants of known clinical significance and variants of unknown clinical significance in providing counseling on whole exome or genome analysis.
6. Explain the concepts of odds ratio and relative and absolute risk, and the limitations in interpretation of genotypic data regarding risk of common disease.

ACMG Genomics Academy

New Educational Paradigms

What is needed to translate genomic information from the lab to the provider? Will collaborative medicine be needed to interpret genomic information?

- We are a long way from having fully annotated the genome
- Point-of-care decision support tools need to be deployed
- Collaborative partnerships will be key
- New counseling paradigms will be needed
