See also poster 77, **Steve Roberts et al.**

ssDNA-specific AID/APOBEC cytidine deaminases

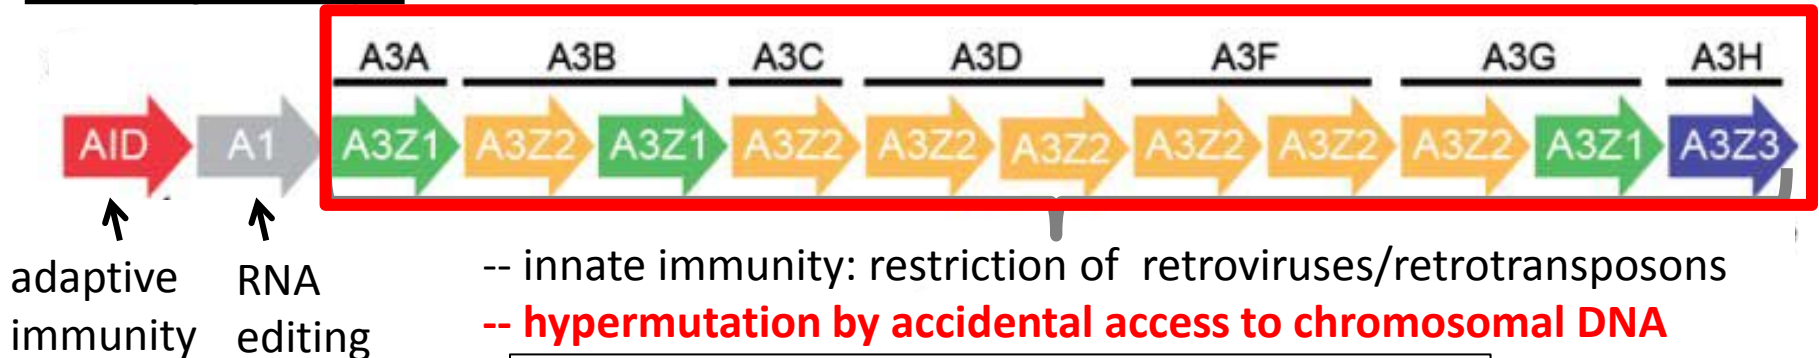

- an endogenous strong mutagen in human cancers

Biochemistry:

- *in vivo* APOBECs can cause **C→T** and **C→G** substitutions
- APOBECs 1/3A/3B/3C/3DE/3F/3H deaminate C in **TCW** motif

Gene family:

APOBEC3B and/or **APOBEC3A** are the current prime suspects for mutagenesis in cancer

Graphics adapted from Refsland and Harris, 2013

APOBEC: a new type of carcinogenic mutagen

Carcinogenic mutagens:

Exogenous:

UV, tobacco, aristolochic acid, occupational chemicals

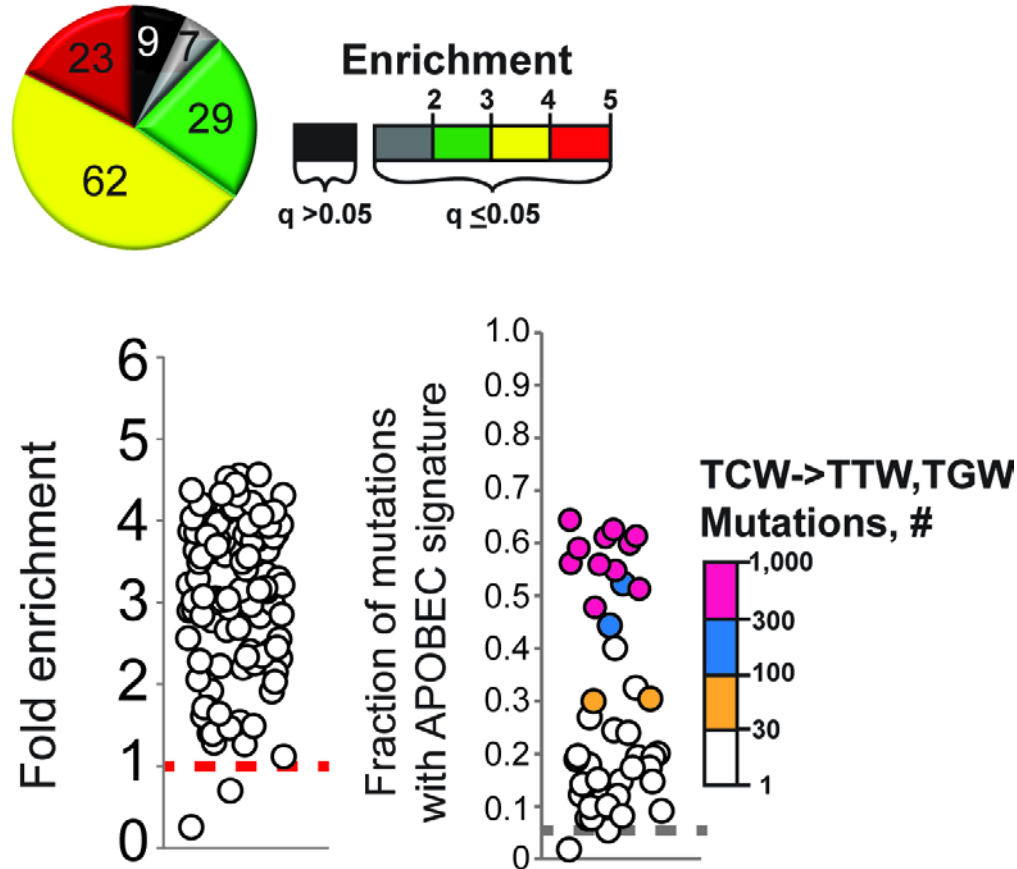

Endogenous: **APOBEC**

Roberts *et al.*, 2012, 2013;

Nik-Zainal *et al.* 2012; Alexandrov *et al.* 2013;

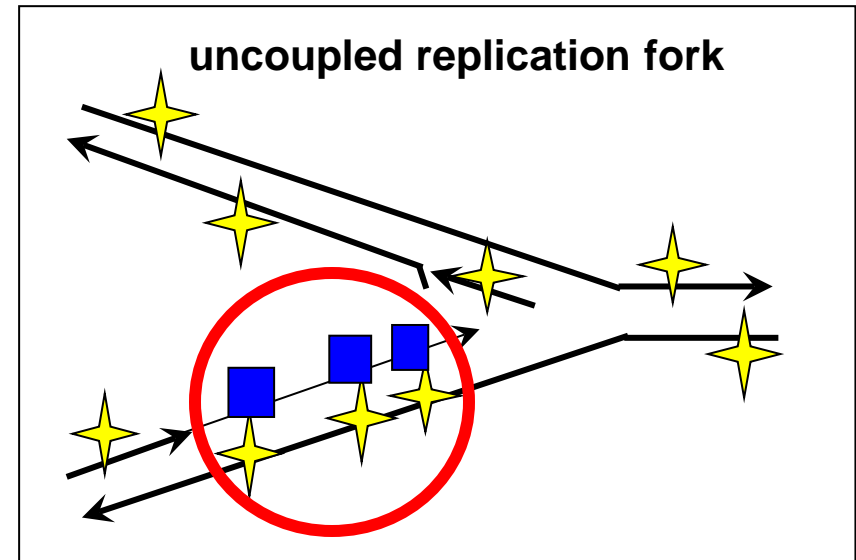

Burns *et al.*, 2013a,b

Example of very strong APOBEC mutagenesis – - muscle invasive urothelial carcinomas of bladder (BLCA).

Findings in model yeast systems: Error-prone Translesion Synthesis in Damaged Long ssDNA can be a Source of Localized Hypermultiplication and Strand-Coordinated Mutation Clusters

Mutation Motifs in C-coordinated clusters.

Roberts et al. *Mol.Cell*, 2012

(example - multiple myelomas)

APOBEC Family Enzymes:

- Edit RNA & restrict retroelements
- **APOBEC 1/3A/3B/3C/3DE/3F/3H** – **TCW** – mutation motif
- strongly prefer **ssDNA** vs dsDNA
- activity in ssDNA gaps results in **C to G** and **C to T** substitutions

C-coordinated mutations

84% are **TC/GA**

81% are **TCW/WGA**

87% are **C→T** or **C→G**

Similar events (termed “kataegis”) also reported in breast cancer. Nik-Zainal...and Stratton, *Cell*, 2012

Hypothesis-based statistics of APOBEC mutagenesis

Hypothesis driven Analysis

Enrichment (E): a Metric for APOBEC mutation pattern:

Roberts et al., *Mol. Cell* 2012

$$E = \frac{MUTATIONS_{TCW \rightarrow TTW \text{ or } TGW} \times CONTEXT_C}{MUTATIONS_{C \rightarrow T \text{ or } G} \times CONTEXT_{TCW}}$$

```

mutations

context

- Reflects short scanning mode of APOBEC enzymes
- Concentrates on “sequence-able” part of the genome
- **Produces sample-specific P-values**
(works even for exome MAFs)

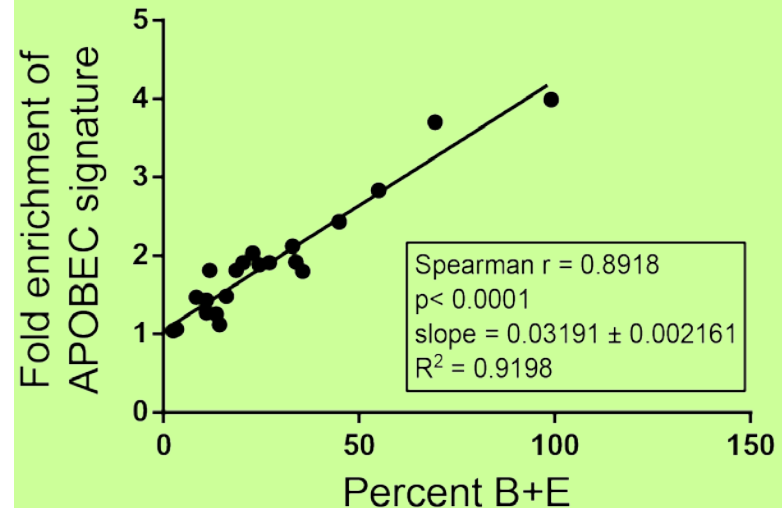

De Novo Pattern Recognition

21 BRCA genomes: Nik-Zainal ... Campbell, Stratton, *Cell* 2012

Comparison of Mutation Signature Algorithms

APOBEC mutation pattern is abundant in cervical, bladder, head and neck, breast, and lung cancer types

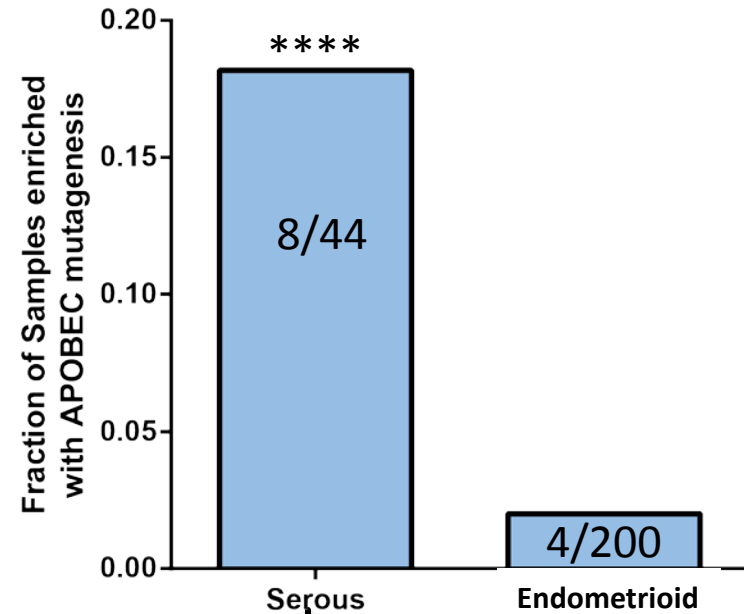

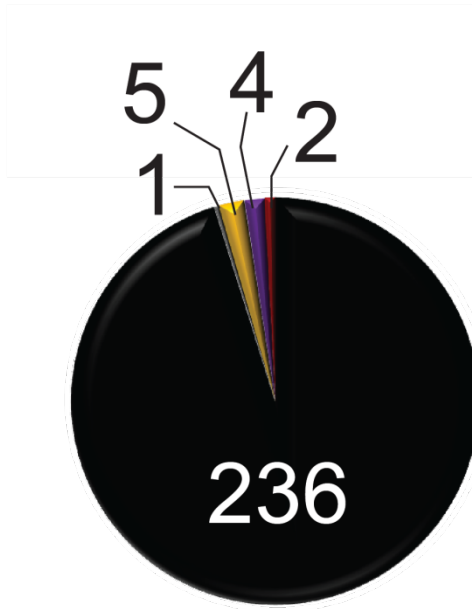

Roberts et al. Nature Genetics, 2013

APOBEC mutagenesis likely occurs in the background of all cancer types, but is more abundant in specific types.

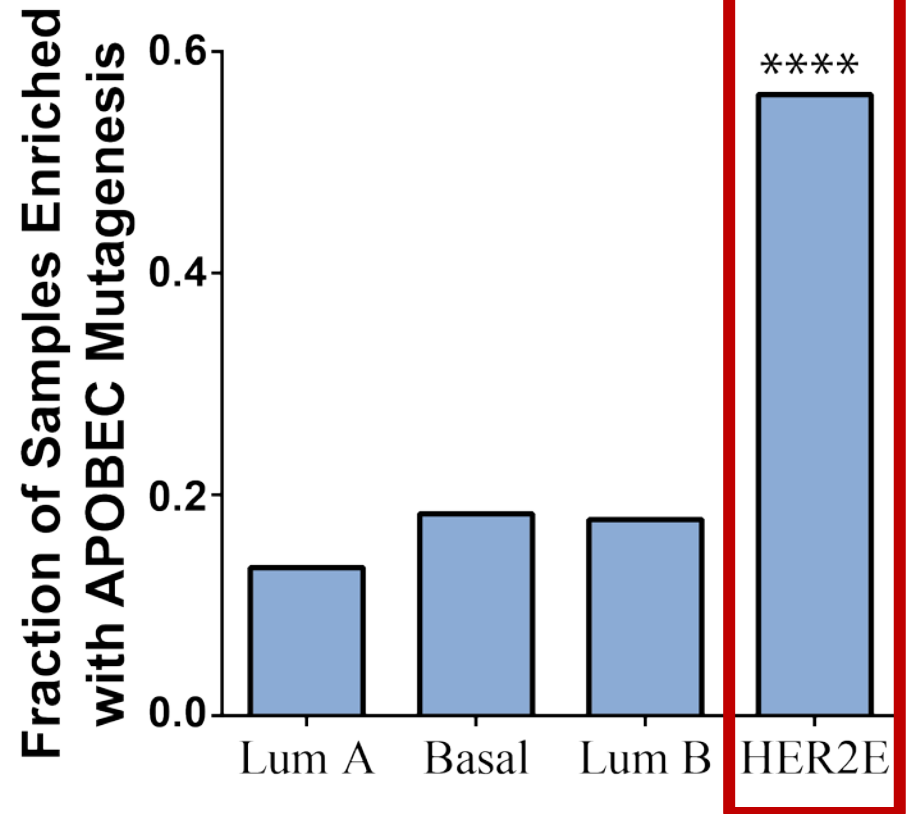

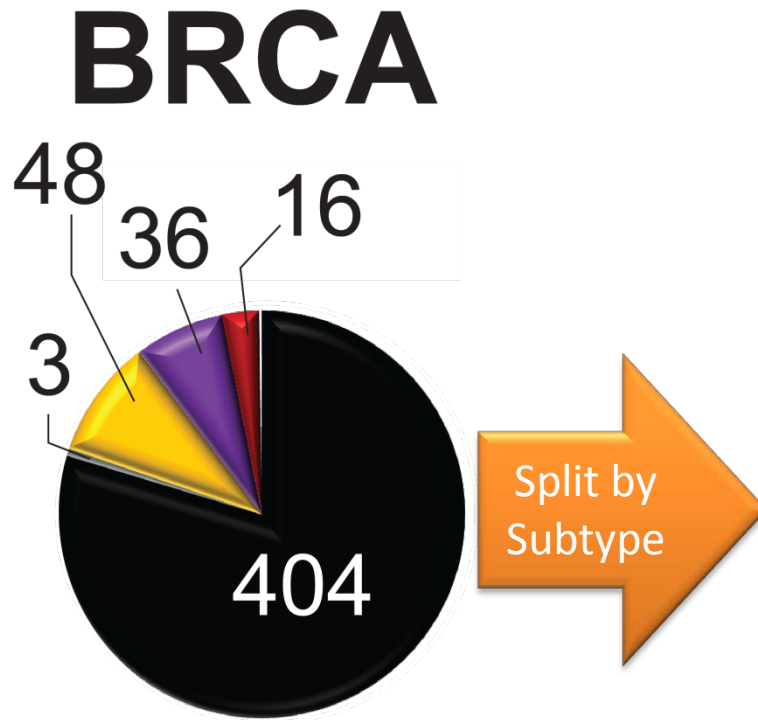

Highlighting rare APOBEC-mutated samples: example – Uterine Corpus Endometrioid Carcinoma (UCEC)

UCEC

Highlighting APOBEC-hypermethylated cancer subtypes: example - HER2-enriched subtype of breast cancer

Roberts *et al.*, 2013

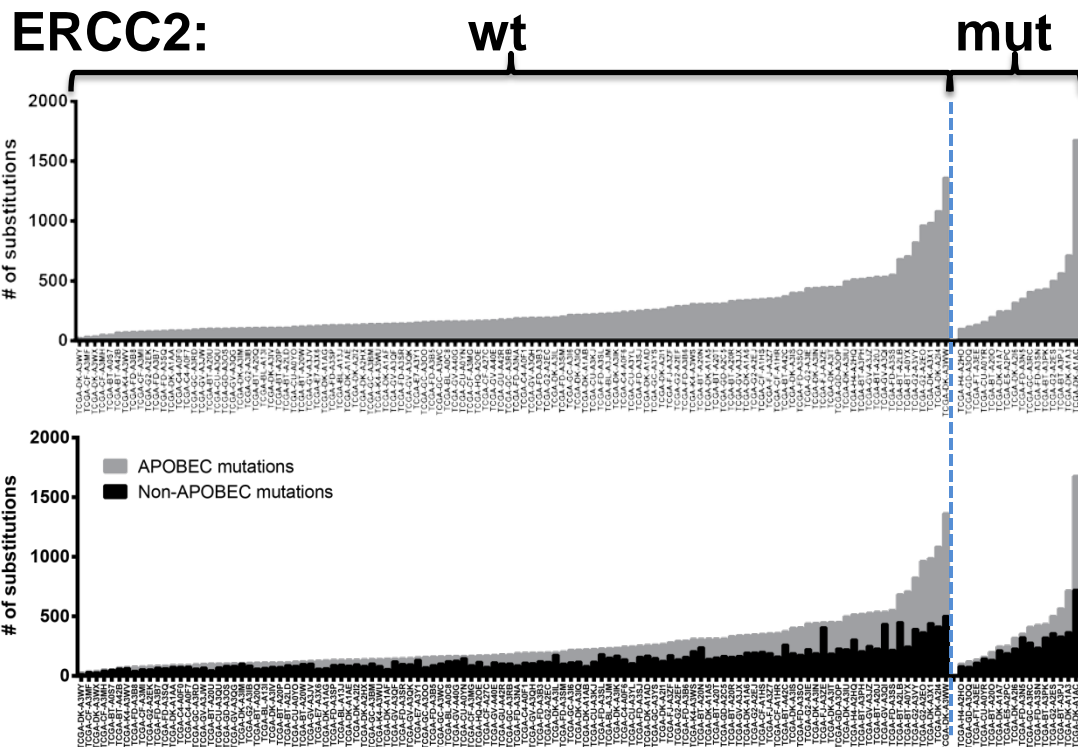

Deconvoluting mutagenic mechanisms within a cancer type: example - increased mutagenesis in ERCC2-mutated bladder cancers (BLCA)

•BLCA SMGs include: *TP53*, *MLL2*, *ARID1A*, *KDM6A*, *PIC3CA*, *EP300*, *CDKN1A*, *RB1*, *ERCC2*...

•*ERCC2* = Excision Repair
 •mutation = little effect on the total # of substitutions

•Subtract APOBEC mutations to reveal mutagenesis in ERCC2 mutated samples

BLCA

TCGA-related efforts

- Input into cancer specific AWGs
- Integrate analysis of APOBEC mutagenesis in cancer exome MAFs into Firehose
- Analyse updated and new TCGA exome MAFs

Combining mechanistic and bioinformatics approaches to understand mutation processes operating in cancer

Yeast

Mechanistic knowledge used to build **stringent statistical hypothesis**

Tumors

Apply to bioinformatics exploration of large databases of clinical mutations (*e.g.* TCGA) **to understand mutagenic mechanisms** relevant for disease
