Clinical Phenotyping in the EMR: Challenges and Opportunities

Josh Denny, MD, MS Jan 22, 2014

Goals of Phenotyping Workgroup

- Develop, validate, and implement ~27 EHR phenotypes for genomic study across eMERGE sites
 - For each phenotype: Lead site develops, validates
 → one to two other sites deploy, validate, revise
 → deploy across network
 - Use existing genotyped records
 - Preserve privacy and promote data/algorithm reuse
- 2. Improve the process of EHR phenotyping

Network Phenotyping Progress

What we learned - Finding phenotypes in the EMR

Sharing algorithms: <u>PheKB.org</u>

a knowledgebase for discovering phenotypes from electronic medical records

Phenotypes Implementations Groups Institutions

PheKB

What is the Phenotype KnowledgeBase?

The reuse of data from electronic medical records (EMRs) and other clinical data systems holds tremendous promise for improving the efficiency and effectiveness of health research. Clinical data in the EMR is a potential source of rich longitudinal data for research, and the recent government efforts to promote the use of EMRs in the clinical setting may further promote the use of such systems in the US healthcare system. As the use of EMRs expands, the demand for usable data from these systems for research has also expanded.

One such effort by the Electronic Medical Records and Genomics Network (eMERGE) has investigated whether data captured through routine clinical care using EMRs can identify disease phenotypes with sufficient positive and negative predictive values for use in genome-wide association studies (GWAS). Most EMRs captured key

information (diagnoses, medications, laboratory tests) used to define phenotypes in a structured format; in addition, natural language processing has also been shown to improve case identification rates.*

PheKB is an outgrowth of that validation effort and provides a collaborative environment of building phenotype algorithms. On this site you can:

- View existing algorithms
- Enter or create new algorithms
- Collaborate with others to create or review algorithms
- View implementation details for existing algorithms

66 phenotypes, 20 public; 73 implementations; PPVs; social networking features; versioning; etc.

Key Questions for eMERGE 3

- What types of phenotypes to explore?
- How to make the process faster/better?
- How to improve accuracy and reproducibility?
- How can we best leverage the unique nature of the EMR?

New Phenotypes for Discovery

- Move beyond just disease-gene to more detailed phenotypes:
 - less common or rare phenotypes
 - pharmacogenomics (*follow-up on eMERGE-PGx*)
 - disease subtypes
 - longitudinal phenotypes
- Phenotypes for clinical implementation (e.g., for CDS)
- Bigger sample sizes are needed, but eMERGE has 350k+ lives covered!
- These may be harder than other phenotypes... may need to decide that **less is more**

Rare phenotypes

- Adverse drug events (Steven-Johnson Syndrome)
- Rare diseases (e.g., Wegener's granulomatosis)

- May have stronger genetic signals
- Clinical impact
- EMR may be best way to capture
- Problem:
 - Would likely need new genotyping/sequencing
 - GWAS may not be detailed enough (rare variants)

New Methods for eMERGE 3

- Expand work on common infrastructures for phenotyping
- Use phenotyping within Clinical Decision Support frameworks
- High throughput phenotyping with machine learning, active learning, etc.
- Phenomic methods (PheWAS, DrugWAS, etc.) to investigate pleiotropy and comorbidity
- Refine phenotype algorithms to include all patient statuses
 - "gray areas" such as probable and suspect cases

Central Resources

- Expand record counter functionality
 - Options of implementing federated queries and automated processes
 - Virtual data warehouses
- Structured data dictionaries and data validation tools
- Sites would contribute to these efforts, but one standard should be set to cooperative development

Key Questions for eMERGE 3

- What types of phenotypes to explore?
 common, rare, pharmacogenomic, subtypes
- How to make the process faster/better?
 new methods, standards, federated search, CDS
- How to improve accuracy and reproducibility?
 standards, extensible methods
- How can we best leverage the unique nature of the EMR?

- phenomic approaches, longitudinal phenotypes
