## Next-generation Sequencer basics

How massively parallel sequencing works

## Next-generation DNA sequencing instruments

- All NGS platforms require a library obtained either by amplification or ligation with custom linkers (adapters)
- Each library fragment is amplified on a solid surface (either bead or flat Si-derived surface) with covalently attached adapters that hybridize the library adapters
- Direct step-by-step detection of the nucleotide base incorporated by each amplified library fragment set
- Hundreds of thousands to hundreds of millions of reactions detected per instrument run = “massively parallel sequencing”
- A “digital” read type that enables direct quantitative comparisons
- Shorter read lengths than capillary sequencers

## Library Construction and Amplification

- Shear high molecular weight DNA with sonication
- Polish ends
- Ligate synthetic DNA adapters (PCR\*)
- Produce size fractions (PCR\*)
- Quantitate
- Amplify library fragments on flow cell surface (PCR\*)
- Denature clusters to single-stranded
- Hybridize sequencing primer to linearized ss cluster DNAs
- Proceed to sequencing or hybrid capture

## PCR-related Problems in NGS

- PCR is an effective vehicle for amplifying DNA, however...
- In NGS library construction, PCR can introduce preferential amplification (“jackpotting”) of certain fragments
  - Duplicate reads with exact start/stop alignments
  - Need to “de-duplicate” after alignment and keep only one pair
  - Low input DNA amounts favor jackpotting due to lack of complexity in the fragment population
- PCR also introduces false positive artifacts due to substitution errors by the polymerase
  - If substitution occurs in early PCR cycles, error appears as a true variant
  - If substitution occurs in later cycles, error typically is drowned out by correctly copied fragments in the cluster
- Cluster formation is a type of PCR (“bridge amplification”)
  - Introduces bias in amplifying high and low G+C fragments
  - Reduced coverage at these loci is a result

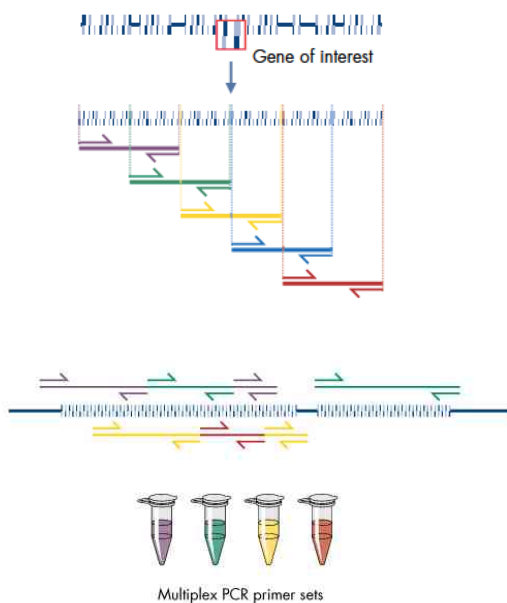

## Hybrid Capture

- **Hybrid capture** - fragments from a whole genome library are selected by combining with probes that correspond to most (not all) human exons or gene targets.
- The probe DNAs are biotinylated, making selection from solution with streptavidin magnetic beads an effective means of purification.
- An “**exome**” by definition, is the exons of all genes annotated in the reference genome.
- **Custom capture reagents** can be synthesized to target specific loci that may be of clinical interest.

## Multiplex PCR Amplification of Targets

1. Design amplification primer pairs for exons of genes of interest; tile primers to overlap fragments in larger exons
2. Group primer pairs according to G+C content,  $T_m$  and reaction condition specifics
3. Amplify genomic DNA to generate multiple products from each primer set; pool products from each set
4. Create library by ligation or tail platform adaptors on the primer ends
5. Sequence

## Massively Parallel Sequencing by Synthesis

Cluster Amplification → PS Linearization → Block with ddNTPS → Denaturation and Sequencing Primer Hybridization

Incorporate  
Detect  
De-block  
Cleave fluor

## Platforms: Illumina

	 MiSeq	 NextSeq 500		 HiSeq 2500		 HiSeq X*
<b>Key applications</b>	Small genome, amplicon, and targeted gene panel sequencing.	Everyday genome, exome, transcriptome sequencing, and more.		Production-scale genome, exome, transcriptome sequencing, and more.		Population-scale human whole-genome sequencing.
<b>Run mode</b>	N/A	Mid-Output	High-Output	Rapid Run	High-Output	N/A
<b>Flow cells processed per run</b>	1	1	1	1 or 2	1 or 2	1 or 2
<b>Output range</b>	0.3-15 Gb	20-39 Gb	30-120 Gb	10-180 Gb	50-1000 Gb	1.6-1.8 Tb
<b>Run time</b>	5-65 hours	15-26 hours	12-30 hours	7-40 hours	< 1 day - 6 days	< 3 days
<b>Reads per flow cell†</b>	25 Million‡	130 Million	400 Million	300 Million	2 Billion	3 Billion
<b>Maximum read length</b>	2 × 300 bp	2 × 150 bp	2 × 150 bp	2 × 150 bp	2 × 125 bp	2 × 150 bp

- High accuracy, range of capacity and throughput
- Longer read lengths on some platforms (MiSeq)
- Improved kits, improved software pipeline and capabilities, cloud compute

### ION Torrent-pH Sensing of Base Incorporation

The diagram illustrates the ION Torrent pH sensing mechanism. On the left, a cross-sectional view shows a **Sensing Layer** on top of a **Sensor Plate**, which is connected to a **Silicon Substrate** with **Bulk**, **Drain**, and **Source** regions. **dNTP** is shown entering a well, and **H<sup>+</sup>** ions are released during base incorporation, causing changes in  $\Delta pH$ ,  $\Delta Q$ , and  $\Delta V$ . On the right, a chemical reaction shows a **Primer** (5' to 3') reacting with **dNTPs** to form a **4dNTPs** product. An example shows a primer sequence **C T A G** being extended by a **C** dNTP, releasing **H<sup>+</sup>**. Below the diagram is a sequencing chromatogram showing signal intensity for bases C, T, A, G across 200 flow cycles.

### Platforms: Ion Torrent

**PGM**

- Three sequencing chips available:
  - 314 = up to 100 Mb
  - 316 = up to 1 Gb
  - 318 = up to 2 Gb
- 2-7 hour/run
- up to 400 bp read length
- 400kreads up to 5 Mreads

**Proton**

- Two human exomes (Proton 1 chip) or one genome (@20X-Proton 2 chip) per run
- Ion One Touch or Ion Chef preparatory modules
- 2-4 hour/run
- ~200 bp average read length
- Proton 1 produces 60-80 Mreads  $\geq 50$  bp

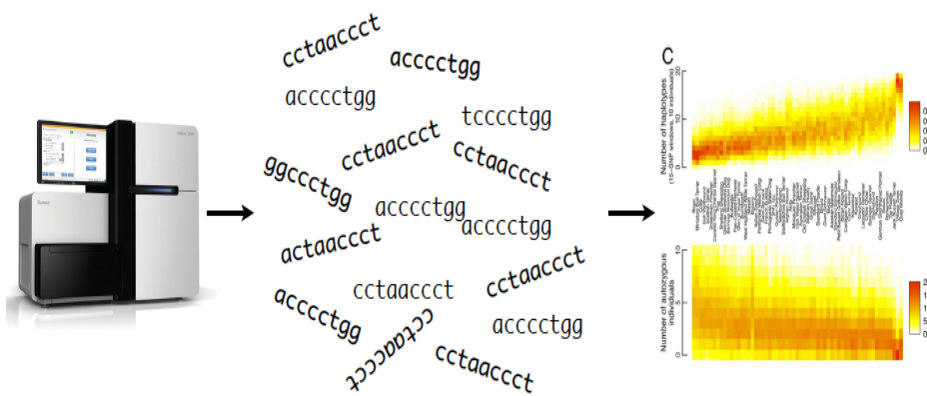

- Low substitution error rate, in/dels problematic, no paired end reads
- Inexpensive and fast turn-around for data production
- Improved computational workflows for analysis

## Post Data Generation Analyses

Bioinformatic and computational approaches to NGS

## The Goal?

Sequence data alignment is the crucial first step!

## Short Read Alignment...

Is like a jigsaw puzzle...

...where they give you the  
cover on the box

## Some pieces are easier to place than others...

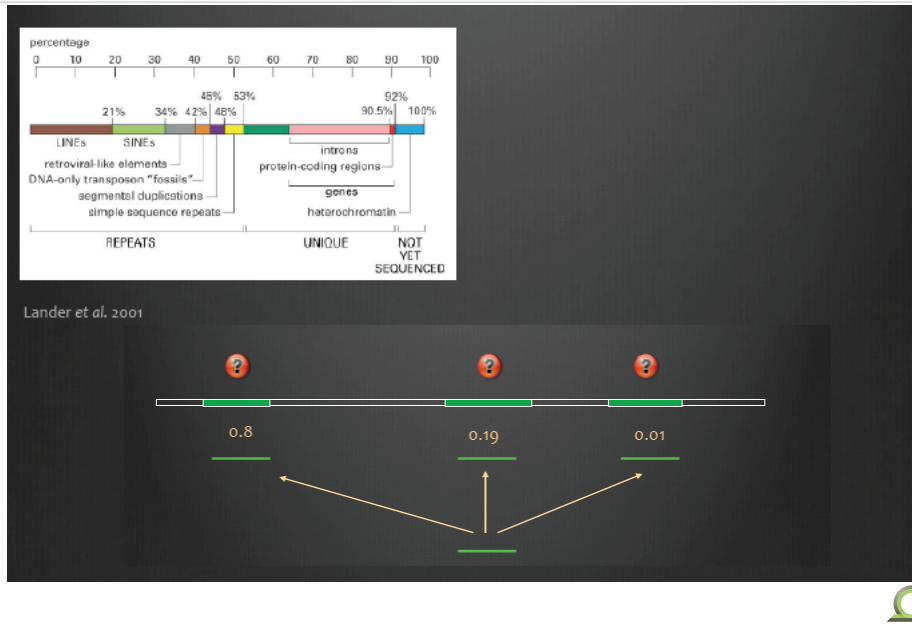

pieces that look like each other...

...pieces with  
unique features

## Repetitive Sequences Result in Multiple Read Alignments

## Reads are Aligned, Now What?

- Data calibration and cleanup:
  - Mark proper pairs (if applicable)
  - Mark duplicate reads!
  - Correct local misalignments
  - Recalculate quality scores
- Call SNPs
- Evaluate Coverage
  - Compare SNPs from NGS to SNPs from array data
  - Integrated Genome Viewer
  - RefCov and others
- Analyze the data

## Integrated Genomics Viewer (IGV)

Whole chromosome view

Zoom in to see more detail

Bases that do not match the reference sequence are highlighted by color

Low-quality base calls are faint, semi-transparent.

## IGV: Somatic Single Nucleotide Variant QC

Normal Sam Coverage

Tumor Sam Coverage

Sequence  
Reference Contig

AGAPv4

## False Negativity/Positivity

- Most false negatives are due to lack of coverage
- False positives are due to multiple reasons, including:
  - Variant is only called on one strand
  - Variant is only called at the end of the read
  - Coverage of the matched normal at that locus is poor
  - Gene has a pseudogene/paralog and the reads are mis-mapped
  - High sensitivity variant calling algorithms have elevated false positive rates to achieve detection of subclonal variants and low false negative rates
- Data that verifies or refutes variant calls can help to define bioinformatic filters to remove them

## Third Generation Sequencers

Variations on a theme

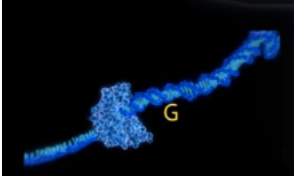

### Real Time Sequencing of Single DNA Molecules

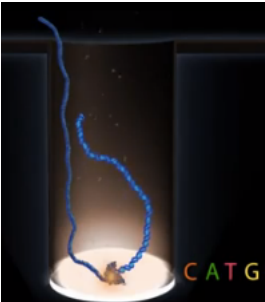

DNA:polymerase complex is immobilized at the ZMW bottom

Fluorescent nucleotides are introduced to the ZMW

A light pulse is produced as each fluorescent base is held in the polymerase active site. The phosphate is cleaved during incorporation, releasing the fluorophore.

The process occurs in parallel in all the loaded ZMWs

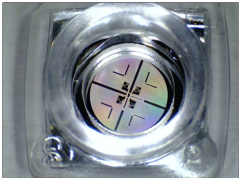

### Pacific Biosciences RS

#### Sample Prep

- Shearing (Covaris/Hydroshear)
- Polish ends
- SMRTbell™ ligation
- Sequencing primer annealing

#### Library/Polymerase Complex

- DNA polymerase binding
- Load library/polymerase complex onto SMRT cell

#### Sequencing

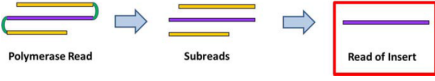

Raw reads

Post-filter reads

Mapped reads

SMRTbell™ Template

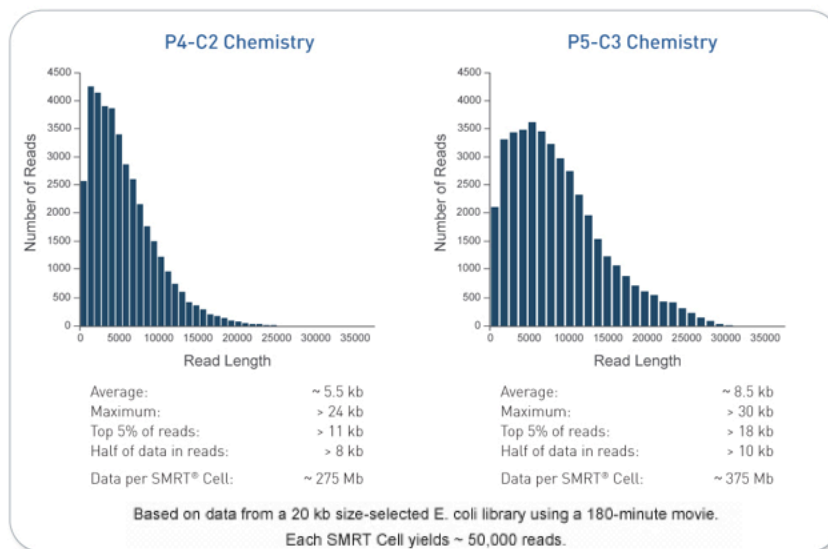

Polymerase Read → Subreads → Read of Insert

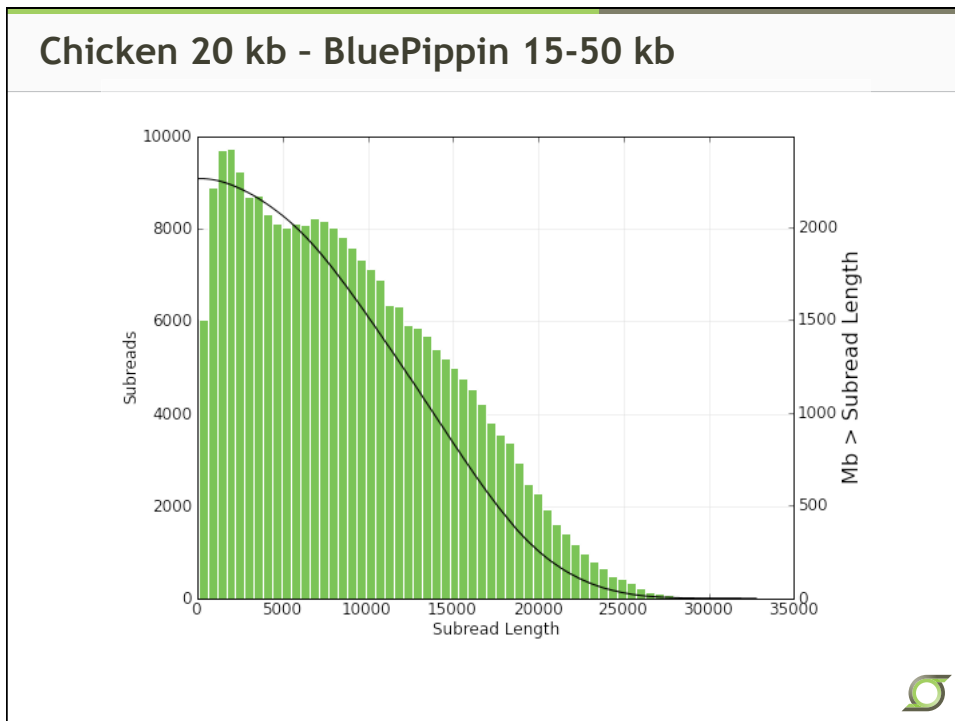

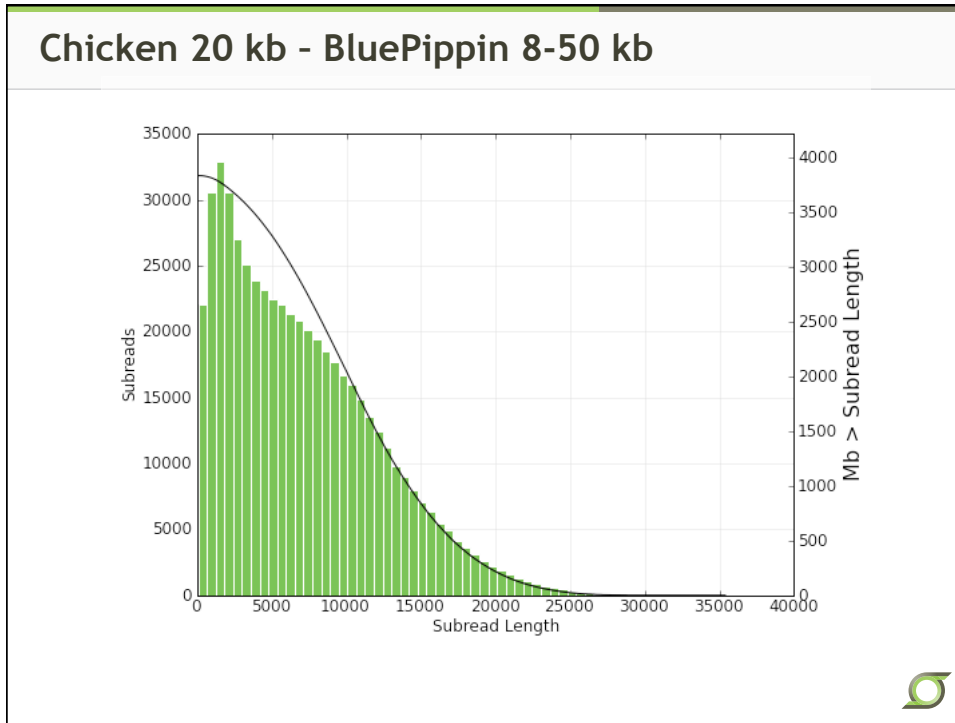

## PacBio: 20 kb Library Preparation and Sequencing

- Covaris g-Tube 20 kb shear
- Pacific Biosciences 20 kb library prep
- Sage Science BluePippin size fractionation
  - 8 - 50 kb
  - 15 - 50 kb
- Pacific Biosciences RSII sequencing
  - Polymerase: P5
  - Sequencing chemistry: C3
  - MagBead loading
  - Per SMRT Cell
    - 180 minute collection time

## Pac Bio: Long reads improve the Human Reference Genome sequence

- Since the HRG finished sequence was announced and published in 2004, our group has continued to improve the reference
  - Addition of new content, including novel content from other human genomes
  - Improvement of previously poorly finished regions
  - Finishing of regions between segmental duplications
- Our new approach to HRG improvement will include sequencing haploid human genomes (hydatidiform mole) with Pacific Biosciences long read sequencing
  - One such genome (CHM1) already has 60X coverage from PacBio
  - An assembly of CHM1 is now being compared to the HRG (grCH38)

## Alignment of CHM1 PacBio assembly to CHM1\_1.1

## Nanopore Sequencing

Exonuclease-aided sequencing

Pore translocation sequencing

## Oxford Nanopore Sequencing

Exonuclease-aided sequencing

- Variable read lengths
- Electrical current-based detection of triplet nucleotides in pore

## Translating the Cancer Genome

Therapeutic Options via NGS and analysis

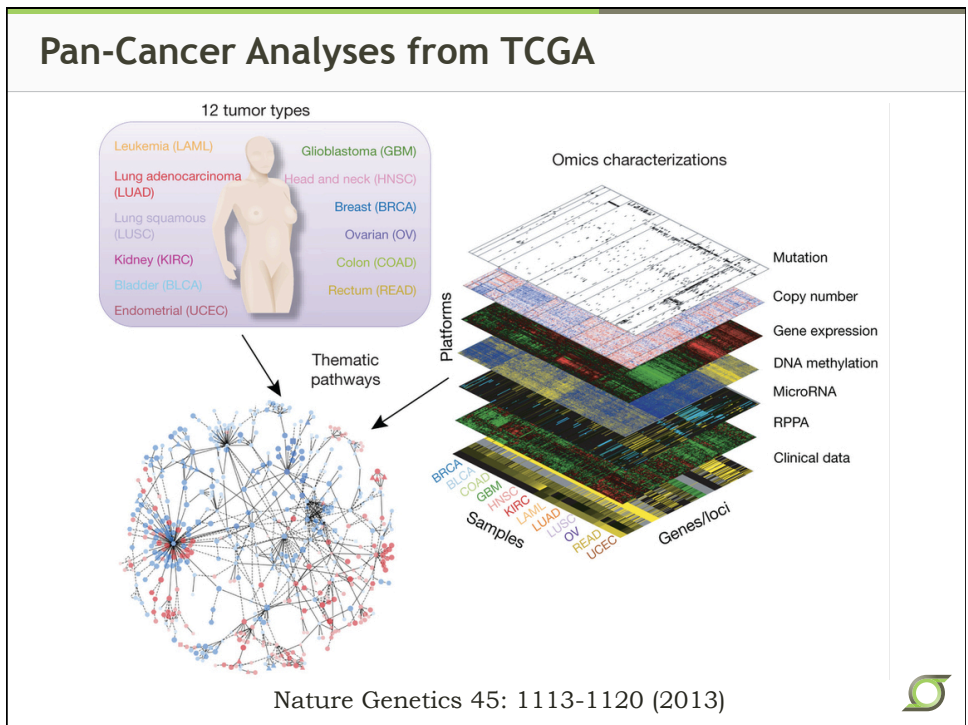

## Cancer is a Disease of the Genome

In the early 1970's, Janet Rowley's microscopy studies of leukemia cell chromosomes suggested that specific alterations led to cancer, laying the foundation for cancer genomics.

## Comprehensive Cancer Genomics

### Integrated WGS/Exome/RNA-Seq

- **WGS** analysis yields:
  - SNVs (single nucleotide variants)
  - CNVs (amplification/deletion)
  - SVs (translocations, inversions)
  - Indels (focused insertions/deletions)
- **Exome**: validates WGS discoveries, integrated coverage depth allows clonality analysis
- **RNA-Seq**: over-expression metrics, expressed SNVs, gene fusions
- **Clinical Action**: identifying druggable targets

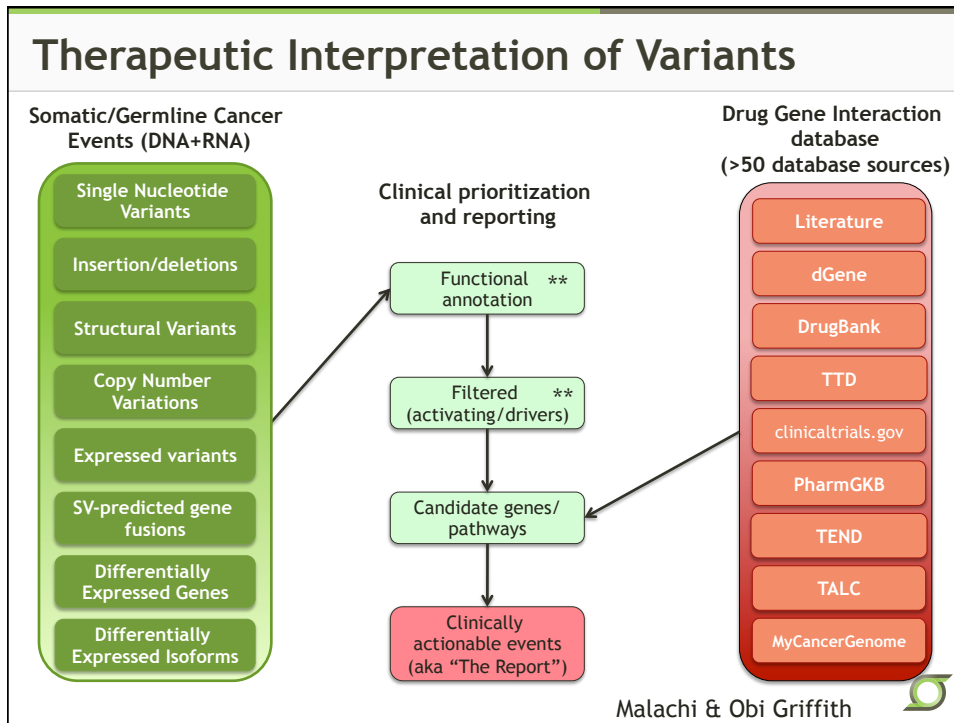

## Linking Somatic Variants to Therapies

Obi Griffith, Ph.D. and Malachi Griffith, Ph.D.

**DoCM**  
DATABASE OF CANONICAL MUTATIONS

DoCM: A Database of Canonical Cancer Mutations

- Highly curated database of mutations having a demonstrated association with cancer
- General information about each somatic variant
  - Chromosomal Location
  - Strand
  - Gene
  - Protein impact of variant (annotation)
  - PubMed ID evidence cited, linked
- Easy to access from the web and programmatically through an API

## DGIdb: Drug Gene Interaction database

**Search Interactions** search for drug-gene int

**Interaction Search Results** drug interactions for your genes

Genes: AKT1, EGFR, TP53, ALK, PRKCA, ABL1

Source Databases: 9 of 9  
 Source Trust Level: 2 of 2  
 Gene Categories: 40 of 40  
 Interaction Types: 33 of 33  
 Anti-Neoplastic Drugs Only

**PRELIMINARY COMMUNICATION**

## Use of Whole-Genome Sequencing to Diagnose a Cryptic Fusion Oncogene

**Breakpoints in chromosomes 15 and 17 resulting in PML-RARA fusion**

Chromosome 15: LOXL1, STOML1, PML. Breakpoint: 72,027,045 bp.

Chromosome 17: RARA. Breakpoint: 357,426,79-357,426,83 bp.

Derived chromosome 15 after 77-kb deletion: LOXL1, PML.

Derived chromosome 17 with 77-kb insertion: RARA, LOXL1, STOML1, PML. PML-RARA fusion.

Welch et al., JAMA 2011: 305(15): 1577-1584.

## Lukas Wartman, M.D. is Patient “ALL1”

**The New York Times**

In Treatment for Leukemia, Glimpses of the Future

**Second Chance:** Lukas Wartman, a leukemia doctor and researcher, developed the disease himself. As he faced death, his colleagues sequenced his cancer genome. The result was a totally unexpected treatment.

By GINA KOLATA  
Published: July 7, 2012

## FLT3 Over-expression in ALL1

**FLT3 Expression**

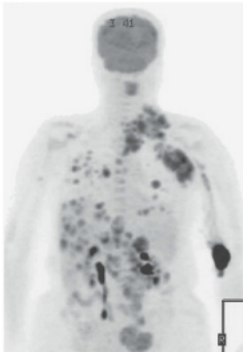

- FLT3 was within the top 1% of all expressed genes.
- Absent a normal comparator, the literature report from Marston identified FLT3 over-expression in pre-B-ALL
- Based on **wt** FLT3 over-expression by the tumor cells, we predicted the cancer would be sensitive to the **FLT3** inhibitor Sunitinib (Sutent) [DrugBank].

Marston E, et al. Blood 2009 Jan 1;113(1):117-26.

## Genome-driven cancer immunotherapy

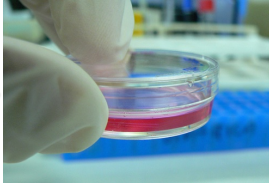

**Sequencing to identify tumor-specific immunopeptides:**

Patient biopsied  
metastatic  
melanoma lesions

Tumor and germline  
DNA sequenced,  
somatic mutations  
identified; RNA  
capture verifies  
expressed mutations  
and expression level;  
netMHC algorithm  
identifies  
immunopeptides

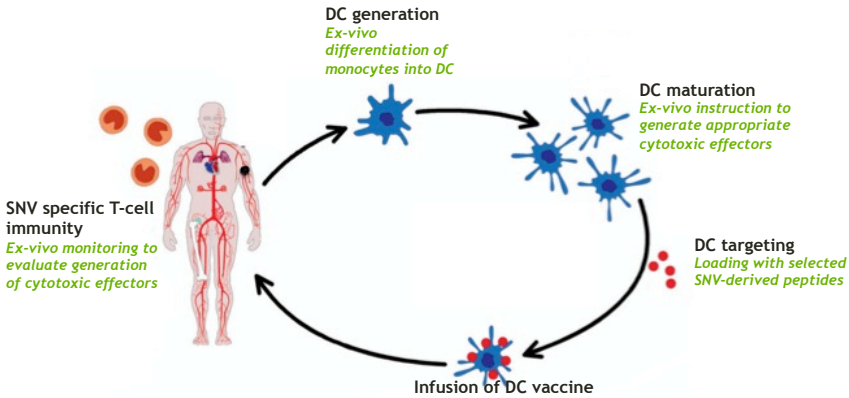

Apheresis samples  
from patient used to  
verify the  
algorithmically-  
identified  
immunopeptides that  
elicit T cell memory

*Mardis, Schreiber et al., Nature 2012*

## Dendritic Cell Vaccine Platform

A dendritic cell-based approach is currently being tested in an FDA approved protocol for **metastatic melanoma** patients:

- Patient 1 has received all three doses of vaccine, and is being monitored
- Patient 2 has received three doses of vaccine, this patient has measurable disease and will be monitored for progression, stability or regression
- Patient 3 has measurable disease, has completed her vaccine infusions early March
- Patients 4 and 5 have genomic analysis completed, in vitro assays completed, GMP peptides underway
