Week 2: Biological Sequence Analysis

Andy Baxevanis, Ph.D.

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Overview

- Week 2
 - Similarity vs. Homology
 - Global vs. Local Alignments
 - Scoring Matrices
 - BLAST
 - BLAT
- Week 3
 - Profiles, Patterns, Motifs, and Domains
 - Structures: VAST, Cn3D, and *de novo* Prediction
 - Multiple Sequence Alignment

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Why do sequence alignments?

- Provide a measure of relatedness between nucleotide or amino acid sequences
 - Determining relatedness allows one to draw biological inferences regarding
 - structural relationships
 - functional relationships
 - evolutionary relationships
- *importance of using correct terminology*

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Defining the Terms

- The quantitative measure: **Similarity**
 - Always based on an observable
 - Usually expressed as percent identity
 - Quantify changes that occur as two sequences diverge (substitutions, insertions, or deletions)
 - Identify residues crucial for maintaining a protein's structure or function
- High degrees of sequence similarity *might* imply
 - a common evolutionary history
 - possible commonality in biological function

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Defining the Terms

- The conclusion: **Homology**
 - Genes *are* or *are not* homologous (not measured in degrees)
 - Homology implies an evolutionary relationship

It is worth repeating here that homology, like pregnancy, is indivisible⁸. You either are homologous (pregnant) or you are not. Thus, if what one means to assert is that 80% of the character states are identical one should speak of 80% identity, and not 80% homology.

Fitch, Trends Genet. 16: 227-231, 2000

Defining the Terms

- The term “homolog” may apply to the relationship
 - between genes separated by the event of speciation (*orthology*)
 - between genes separated by the event of genetic duplication (*paralogy*)

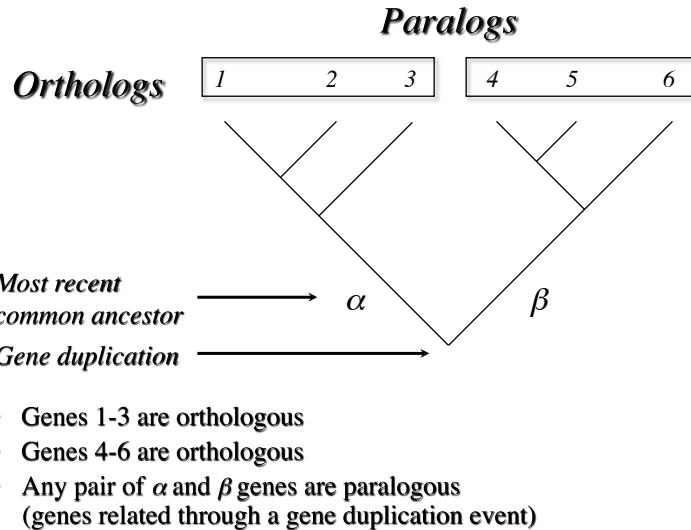

Defining the Terms

- Orthologs
 - Sequences are direct descendants of a sequence in a common ancestor
 - Most likely have similar domain structure, three-dimensional structure, and biological function
- Paralogs
 - Related through a gene duplication event
 - Provides insight into “evolutionary innovation” (adapting a pre-existing gene product for a new function)

Defining the Terms

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Overview

- Week 2
 - Similarity vs. Homology
 - Global vs. Local Alignments
 - Scoring Matrices
 - BLAST
 - BLAT
- Week 3
 - Profiles, Patterns, Motifs, and Domains
 - Structures: VAST, Cn3D, and *de novo* Prediction
 - Multiple Sequence Alignment

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Global Sequence Alignments

- Sequence comparison along the entire length of the two sequences being aligned
- Best for highly-similar sequences of similar length
- As the degree of sequence similarity declines, global alignment methods tend to miss important biological relationships

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Local Sequence Alignments

- Sequence comparison intended to find the most similar regions in the two sequences being aligned (“paired subsequences”)
- Regions outside the area of local alignment are excluded
- More than one local alignment could be generated for any two sequences being compared
- Best for sequences that share some similarity, or for sequences of different lengths

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Scoring Matrices

- Empirical weighting scheme representing physicochemical and biological characteristics of nucleotides and amino acids
 - Side chain structure and chemistry
 - Side chain function
- Amino acid-based examples:
 - Cys/Pro important for structure and function
 - Trp has bulky side chain
 - Lys/Arg have positively-charged side chains

Scoring Matrices

- **Conservation:** What residues can substitute for another residue and not adversely affect the function of the protein?
 - Ile/Val - both small and hydrophobic
 - Ser/Thr - both polar
 - *Conserve charge, size, hydrophobicity, other physicochemical factors*
- **Frequency:** How often does a particular residue occur amongst the entire constellation of proteins?

Scoring Matrices

- Why is understanding scoring matrices important?
 - Appear in all analyses involving sequence comparison
 - Implicitly represent particular evolutionary patterns
 - Choice of matrix can strongly influence outcomes of analyses

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Matrix Structure: Nucleotides

- *Simple match/mismatch scoring scheme:*

Match +2
Mismatch -3

	A	T	G	C
A	2	-3	-3	-3
T	-3	2	-3	-3
G	-3	-3	2	-3
C	-3	-3	-3	2

- Assumes each nucleotide occurs 25% of the time

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

BLOSUM62

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
 Division of Intramural Research

BLOSUM Matrices

- Henikoff and Henikoff, 1992
- Blocks Substitution Matrix
 - Look only for differences in conserved, ungapped regions of a protein family (“blocks”)
 - Directly calculated, using no extrapolations
 - More sensitive to detecting structural or functional substitutions
 - Generally perform better than PAM matrices for local similarity searches (Henikoff and Henikoff, 1993)

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
 Division of Intramural Research

BLOSUM *n*

- Calculated from sequences sharing no more than *n%* identity
- Contribution of sequences > *n%* identical clustered and weighted to 1

A+T Hook Domain (Block IPB000637B)

2,000 blocks representing > 500 groups of related proteins

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

BLOSUM *n*

- Clustering reduces contribution of closely-related sequences (less bias towards substitutions that occur in the most closely-related members of a family)
- Substitution frequencies are more heavily-influenced by sequences that are more divergent than this cutoff
- Reducing *n* yields more distantly-related sequences

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Which one to choose?

BLOSUM	% Similarity
90	Short alignments, highly similar
80	Best for detecting known members of a protein family
62	Most effective in finding all potential similarities
30	Longer, weaker local alignments

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

So many matrices...

*No single matrix is
the complete answer for
all sequence comparisons*

Current Protocols in Bioinformatics

- **PAM Matrices**
 - **BLOSUM Matrices**
 - **Specialized Scoring Matrices**

Selecting the Right Protein-Scoring Matrix

OVERVIEW

Every program for searching protein sequences against a database includes a choice of "protein-scoring matrix," also called "scoring matrix." This choice adds selectivity to the search, while statistical significance adds selectivity (see user 4). Virtually every user chooses the default, typically PAM 25, BLOSUM62. Despite the fact that the choice of matrix strongly influences the outcome of the analysis, most users do not know why a particular matrix should be used. In general scoring matrices implicitly represent a particular theory of protein sequence evolution, and provide guidance in the choice of a scoring matrix, as well as the management of the search process. PAM and BLOSUM matrices can aid in making the proper choice. The selection of PAM matrix must be made after which the selection of BLOSUM matrix is discussed, and finally a brief overview of the wide variety of specialized scoring matrices provided.

PAM MATRICES
PAM, a rearranged version derived from Acquired Point Mutation (Doolittle, 1978), is a scoring matrix for sequence comparison that is derived by comparing the frequency of replacement in closely related sequences to the frequency expected from the commonly random distribution of amino acids. The basis for this scoring system is the observation that the evolution of protein sequences is a nonrandom process. Some amino acid substitutions occur much more frequently than others, especially in related sequences. Amino acid substitution rates are not uniform, nor are they independent of hydrophobicity among other characteristics. One would expect that the substitution of glycine for proline, for example, would have a greater effect on a protein's structure and function than the substitution of alanine. For instance, the rate of substitution of proline for arginine is that if two aligned sequences differ at one position, the probability of a substitution of a higher than expected percentage of these character substitutions, the sequences are related. As a result, the PAM matrices are used and use of the PAM matrices is given in George et al. (1996).

UNIT 3.

calculated by PAM 1 matrix. Higher matrices are derived by multiplying the matrices by itself a defined number of times. For example, a PAM 160 matrix is the result of 160 matrix multiplications of the PAM 2 matrix against itself. Similarly, the PAM 250 is derived by multiplying the PAM 1 matrix against itself 250 times.

It has been shown by many authors that the PAM 250 matrix is a good predictor of protein secondary structure. It is also known that the PAM 250 matrix contains 2.5 amino acid replacements in each M/T regarding insertions and deletions. This means that one can predict whether a protein will have a proline at a certain time. It is possible that an amino acid is changed to a glycine, then to a proline, and then back to an alanine. These silent mutations are derived from observed amino acid sequence data in protein families and species.

1

Finding Similarities Inferring Homology

3.5.1

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Gaps

- Compensate for insertions and deletions
 - Used to improve alignments between two sequences
 - Must be kept to a reasonable number, to not reflect a biological implausible scenario
(~1 gap per 20 residues good rule-of-thumb)
 - Cannot be scored simply as a “match” or a “mismatch”

Affine Gap Penalty

Fixed deduction for introducing a gap *plus*
an additional deduction proportional to the length of the gap

$$\text{Deduction for a gap} = G + Ln$$

	nucleotide	protein
where G = gap-opening penalty	5	11
L = gap-extension penalty	2	1
n = length of the gap		
and $G > L$

BLAST

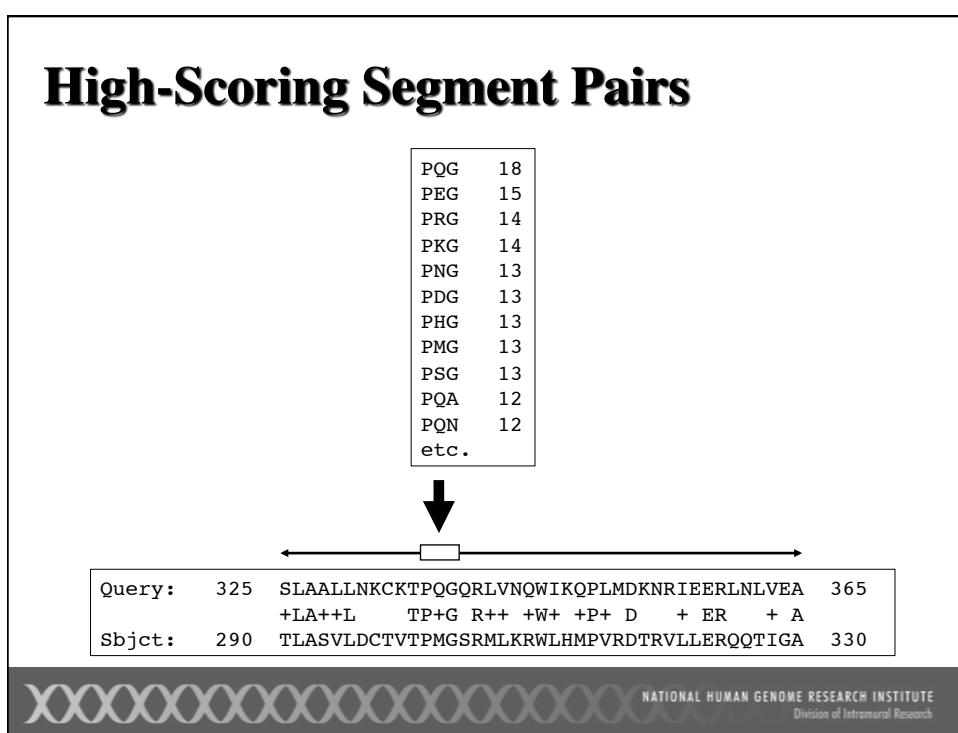

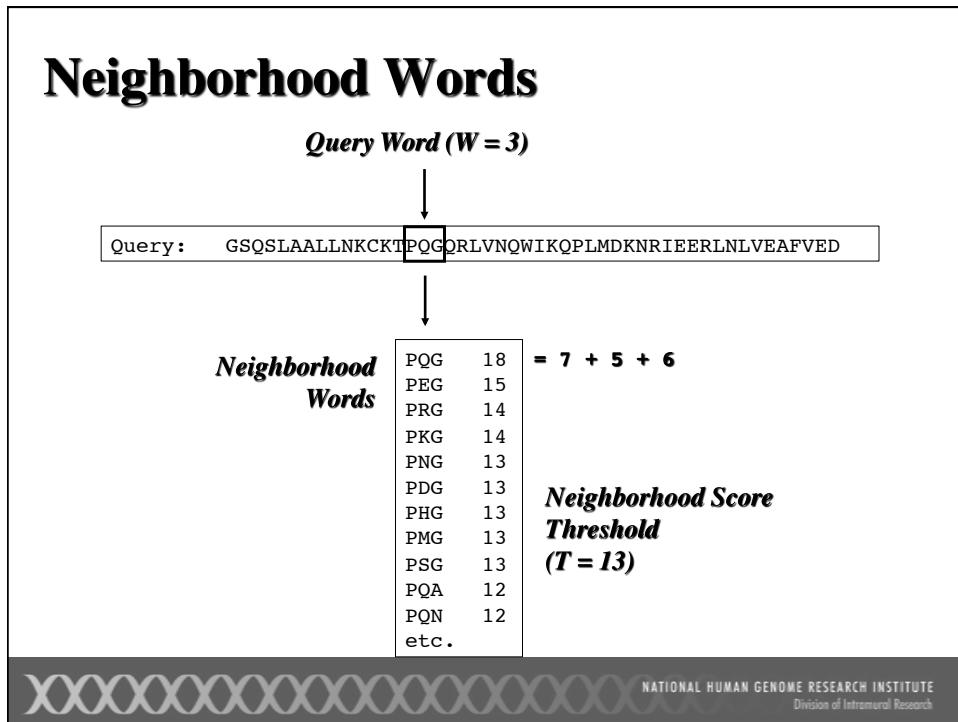

- Basic Local Alignment Search Tool
- Seeks high-scoring segment pairs (HSP)
 - pair of sequences that can be aligned with one another
 - when aligned, have maximal aggregate score (score cannot be improved by extension or trimming)
 - score must be above score threshold S
 - gapped or ungapped
- Results not limited to the “best HSP” for any given sequence pair

Specialized BLAST

Choose a type of specialized search (or database name in parentheses.)

- Make specific primers with [Primer-BLAST](#)
- Search trace archives
- Find conserved domains in your sequence (cds)
- Find sequences with similar conserved domain architecture (cdar)
- Search sequences that have gene expression profiles (GEO)
- Search immunoglobulins (IgBLAST)
- Search for SNPs (srnp)
- Screen sequence for vector contamination (vecscreen)
- Align two (or more) sequences using BLAST (blast2seq)
- Search protein or nucleotide targets in PubChem BioAssay
- Search SRA transcript libraries

Available protein databases include:

- nr** Non-redundant
- refseq** Reference Sequences
- swissprot** SWISS-PROT
- pat** Patents
- pdb** Protein Data Bank
- env_nr** Environmental samples

RefSeq

- **Goal:** Provide a single reference sequence for each molecule of the central dogma (DNA, mRNA, protein)
- **Distinguishing Features**
 - Non-redundancy
 - Updates to reflect the current knowledge of sequence data and biology
 - Ongoing curation by NCBI staff and collaborators, with review status indicated on each record

The screenshot shows the Protein BLAST search interface. In the 'Scoring Parameters' section, the 'Matrix' dropdown is set to 'BLOSUM62'. A callout box highlights this selection along with other matrices: PAM30, PAM70, BLOSUM80, BLOSUM62, and BLOSUM45.

The screenshot shows the Protein BLAST search interface. In the 'Filters and Masking' section, the 'Filter' checkbox is checked, and the 'Low complexity regions' option is selected. A callout box highlights this selection along with other filtering options: 'Mask for lookup table only' and 'Mask lower case letters'.

Low-Complexity Regions

Defined as regions of biased composition

- Homopolymeric runs
 - Short-period repeats
 - Subtle over-representation of several residues

>gi|20455478|sp|P50553|ASC1_HUMAN Achaete-scute homolog 1 (HASH1)
MESSAKMESGGAGQQQPQPPQFPFLPPAACFFA[AAAAAAAAAAAAAQSAQoooooooooooo]APQLRPA

SSYDSEGGSDYPLSPPEOELDDTFNTWF

Homopolymeric alanine-glutamine tract

Identifying Low-Complexity Regions

- Biological origins and role not well-understood
 - DNA replication errors (polymerase slippage)?
 - Unequal crossing-over?
 - May confound sequence analysis
 - BLAST relies on uniformly-distributed amino acid frequencies
 - Often lead to false positives
 - Filtering is advised (but *not* enabled by default)

Suggested BLAST Cutoffs

	<i>E</i> -value	Sequence Identity
Nucleotide	$\leq 10^{-6}$	$\geq 70\%$
Protein	$\leq 10^{-3}$	$\geq 25\%$

- *Do not use these cutoffs blindly!*
- *Pay attention to alignments on either side of the dividing line*
- *Do not ignore biology!*

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

Database Searching Artifacts

- Low-complexity regions
- Repetitive elements
 - LINEs, SINEs, retroviral repeats
 - Choose “Filter: Species-Specific Repeats” when using BLASTN
 - RepeatMasker
<http://www.repeatmasker.org>
- Low-quality sequence hits
 - Expressed sequence tags (ESTs)
 - Single-pass sequence reads from large-scale sequencing (possibly with vector contaminants)

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

BLAST 2 Sequences

- Finds local alignments between two protein or nucleotide sequences of interest
 - All BLAST programs available
 - Select BLOSUM and PAM matrices available for protein comparisons
 - Same affine gap costs (adjustable)
 - Input sequences can be masked

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

<http://www.ncbi.nlm.nih.gov/BLAST>

A screenshot of the NCBI BLAST search interface. The URL "http://www.ncbi.nlm.nih.gov/BLAST" is visible in the browser's address bar. The page has several sections: "Basic BLAST Assembled Genomes" (listing species like Human, Mouse, Rat, and Arabidopsis thaliana), "Basic BLAST" (listing programs like nucleotide blast, protein blast, etc.), and "Specialized BLAST" (listing various specialized search options). A red arrow points from the text "Search a nucleotide database using a nucleotide query" towards the "nucleotide blast" link.

The screenshot shows the NCBI BLAST search interface. The main search parameters are set to search the Human genomic + transcript database using Megablast. The program selection is set to "Highly similar sequences (megablast)". Algorithm parameters include a word size of 28, a match/mismatch score of 1, and a gap penalty of -2. The scoring parameters are set to 1, -2.

Nucleotide-Based BLAST Algorithms

	W	+/-	Gaps
<i>Optimized for aligning very long and/or highly similar sequences (> 95%)</i>			
MegaBLAST (<i>default</i>)	28	1, -2	Linear
<i>Better for diverged sequences and/or cross-species comparisons (< 80%)</i>			
Discontiguous MegaBLAST	11	2, -3	Affine
BLASTN	11	2, -3	Affine
<i>Finding short, nearly exact matches (< 20 bases)</i>			
BLASTN <i>E = 1000, all filtering off</i>	7	2, -3	Affine

Overview

- Week 2
 - Similarity vs. Homology
 - Global vs. Local Alignments
 - Scoring Matrices
 - BLAST
 - BLAT
- Week 3
 - Profiles, Patterns, Motifs, and Domains
 - Structures: VAST, Cn3D, and *de novo* Prediction
 - Multiple Sequence Alignment

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

BLAT

- “BLAST-Like Alignment Tool”
- Designed to rapidly-align longer nucleotide sequences ($L \geq 40$) having > 95% sequence similarity
- Can find exact matches reliably down to $L = 33$
- Method of choice when looking for exact matches in nucleotide databases
- 500 times faster for mRNA/DNA searches
- May miss divergent or shorter sequence alignments
- Can be used on protein sequences

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

When to Use BLAT

- To characterize an unknown gene or sequence fragment
 - Find its genomic coordinates
 - Determine gene structure (the presence and position of exons)
 - Identify markers of interest in the vicinity of a sequence
- To find highly-similar sequences
 - Identify gene family members
 - Identify putative homologs
- To display a specific sequence as a separate track

NATIONAL HUMAN GENOME RESEARCH INSTITUTE
Division of Intramural Research

The screenshot shows the UCSC Genome Bioinformatics website. The URL <http://genome.ucsc.edu> is displayed in the browser's address bar. The main navigation menu includes Genomes, Blat, Tables, Gene Sorter, PCR, VisiGene, Proteome, Session, FAQ, and Help. The 'Blat' link is highlighted. On the left, there is a vertical sidebar with links to Genome Browser, ENCODE, Table Browser, Gene Sorter, In Silico PCR, Genome Graphs, Galaxy, VisiGene, Proteome Browser, Utilities, Downloads, Release Log, Custom Tracks, Archaeal Genomes, Mirrors, Archives, Training, Credits, Publications, Cite Us, and Licenses. The main content area features a section titled 'About the UCSC Genome Bioinformatics Site' with a brief welcome message and information about the ENCODE project. Below this is a 'News' section with several news items, including one about a job posting for a Biological Data Technician and another about the default genome browser being changed from hg18 to hg19. At the bottom, there is a 'Conditions of Use' section with a note about freely available data and restrictions.

submit **I'm feeling lucky** **clear**

Paste in a query sequence to find its location in the genome. Multiple sequences may be searched separated by lines starting with '>' followed by the sequence name.

File Upload: Rather than pasting a sequence, you can choose to upload a text file containing the sequence.
 Upload sequence: **(Choose File)** no file selected **submit file**

Only DNA sequences of 25,000 or fewer bases and protein or translated sequence of 10000 or fewer letters will be processed. Up to 25 sequences can be submitted at the same time. The total limit for multiple sequence submissions is 50,000 bases or 25,000 letters.

For locating PCR primers, use [In-Silico PCR](#) for best results instead of BLAT.

About BLAT

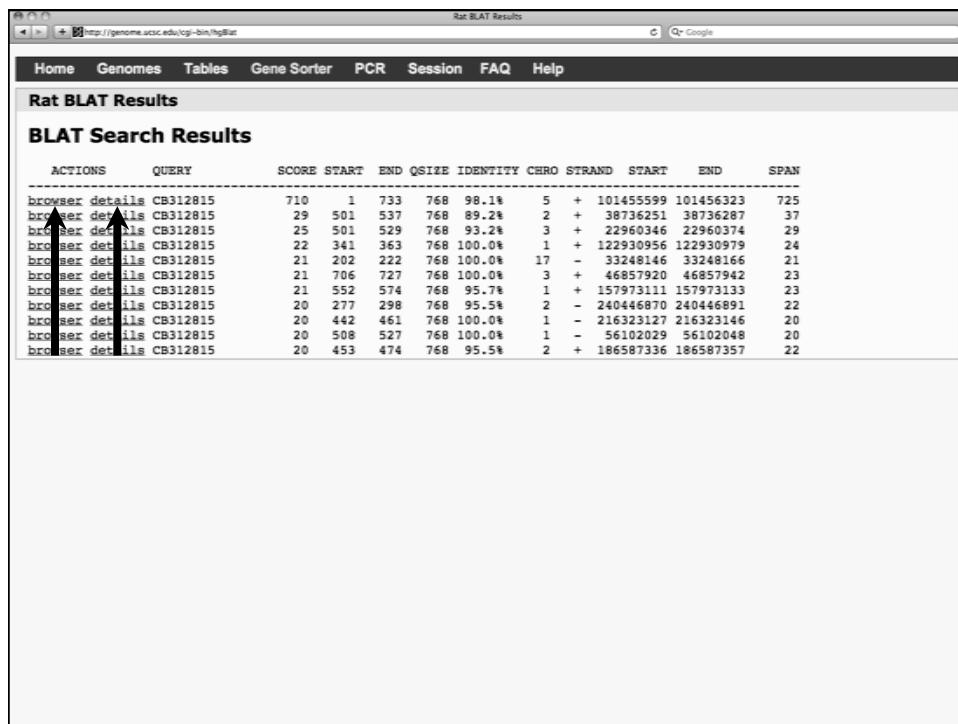

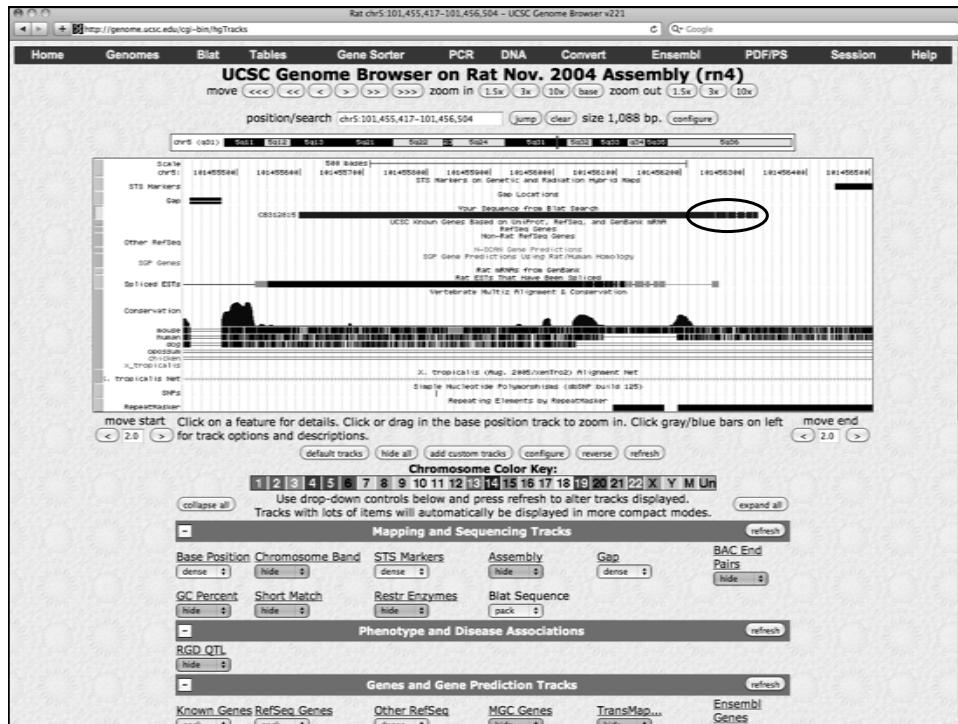

BLAT on DNA is designed to quickly find sequences of 95% and greater similarity of length 25 bases or more. It may miss more divergent or shorter sequence alignments. It will find perfect sequence matches of 25 bases, and sometimes find them down to 20 bases. BLAT on proteins finds sequences of 80% and greater similarity of length 20 amino acids or more. In practice DNA BLAT works well on primates,

FASTA

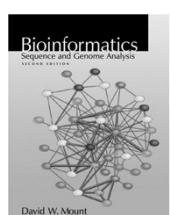

- Identifies regions of local alignment
- Employs an approximation of the Smith-Waterman algorithm to determine the best alignment between two sequences
- Method is significantly different from that used by BLAST
- Online implementations at
<http://fasta.bioch.virginia.edu>
<http://www.ebi.ac.uk/fasta33>
