Concept Clearance: Multi-omics for Health and Disease

Joannella Morales, PhD

On behalf of the Multi-Omics Team: Erin Ramos and Teri Manolio

Division of Genomic Medicine

NHGRI Advisory Council Meeting February 7, 2022

National Human Genome Research Institute

Recent NHGRI efforts on Multi-Omics

- June 2021: Hosted workshop to review state of the field and gather recommendations
- Sept 2021: Provided Report to Council on workshop and recommendations
- Nov 2021: New approach: Sought preliminary feedback from Council early in the concept development process

Preliminary Council Feedback

A C G

- 11/18: H. Chang, I. Kullo, L. Pennachio, S. Rich, O. Troyanskaya;
 11/29: H. Dietz
- Outline version of concept was presented
- Council generally enthusiastic; No follow up meeting requested
- Recommendations:
 - Clearly articulate the primary objective and desired outcomes
 - Increase linkage between sample collection and data production
 - Centralize data analysis while ensuring collaborative effort
 - Expand proposed list of 'omics assays

Advances in high-throughput technologies

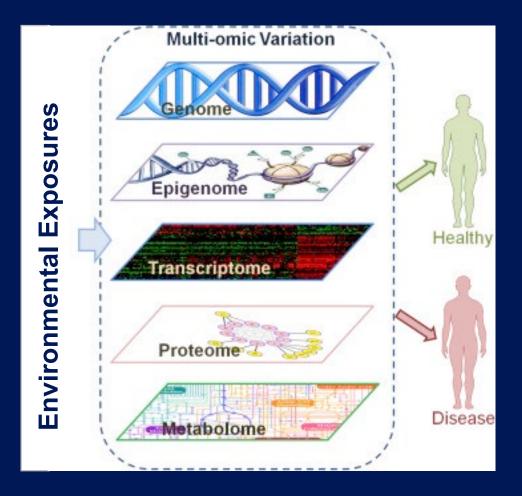

Increased access to distinct molecular data types ('omics data)

	Genomics	Epigenomics	Transcriptomics	Proteomics	Metabolomics
			Image: selection of the selection		
	DNA (e.g. SNP or WGS)	Chromatin accessibility Chromatin structure DMA methylation	mRNA Non-coding RNA (e.g. miRNA, piRNA, IncRNA)	Secreted and intracellualr proteins	Endogenous circulating metabolites Xenobiotics

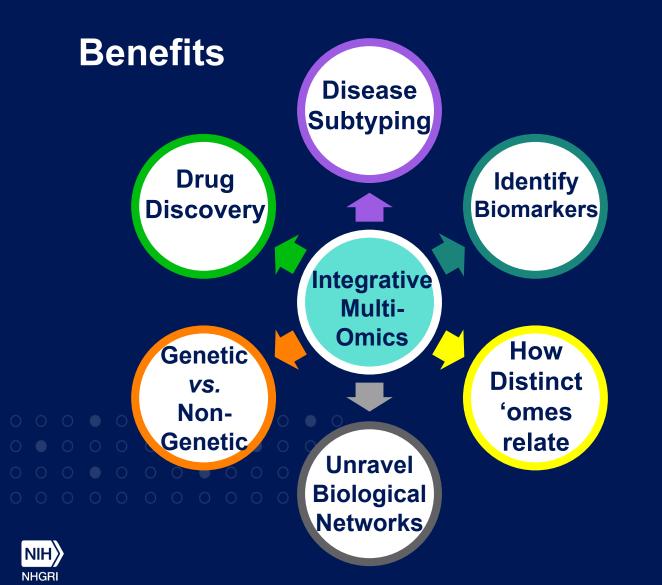

Multi-Omics Defined

- Systems biology approach
- Data sets are multiple 'omes
- Integration -> increased insights
- Comprehensive assessment
- High-throughput technologies
- "Big data" 。
- Interdisciplinary expertise

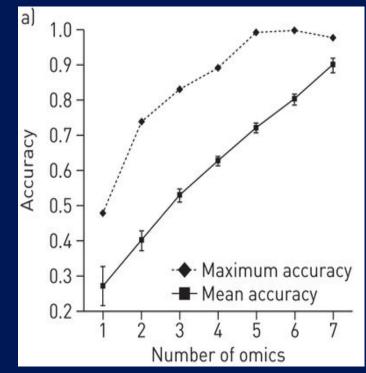

Multi-Omics Integration

Some successes! e.g. Improved classification of COPD

Integration of multi-omics datasets enables molecular classification of COPD; Li *et. al.*

Gaps and Opportunities

		A C
	Production of multiple 'omics data from same sample	 Inter and intra 'ome variability Non-uniform content across platforms and assays Lack of consensus approaches for QA and imputation
	Computational methods to integrate, analyze, and interpret	 Multiple 'omes from the same sample Multi-omics + clinical + environmental exposure data Across diverse populations
Ì		
	Prospective data collections	 Informed consent for broad data sharing/ General Research Use Well-described and harmonized metadata Collection of major 'omics data types

Purpose

- Validate and enhance generalizable multi-omics approaches to identify biological changes related to disease
 - Explore the use of multi-omics to detect and assess molecular "profiles" associated with healthy and disease states
 - Leverage exploratory studies to develop generalizable data harmonization, integration, and analysis methods, best practices, and standards
- Create a multi-dimensional dataset and portal that is available to the wider research community and is interoperable with existing resources (TOPMed, GTEx etc.)

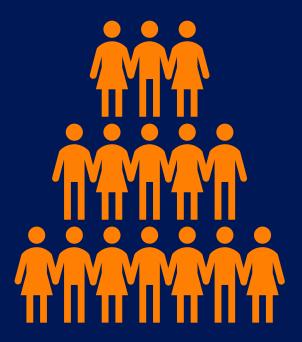

Program Structure: Multi-Omics Consortium

Disease Study Sites (DSS, 4-5)

- Focus on a disease area with evidence that integrative multi-omics would be impactful:
 - Relapsing diseases
 - Heterogeneous diseases
 - Diseases with distinct stages or transitions
- Recruit / re-consent 200-300 participants:
 - Appropriate consent and community engagement
 - 75% underrepresented ancestral backgrounds
 - Standard measures for phenotypes and environmental exposures, (*e.g.* SDOH)
- Collect specimens at minimum of 3 timepoints (tissues/cells, as needed)

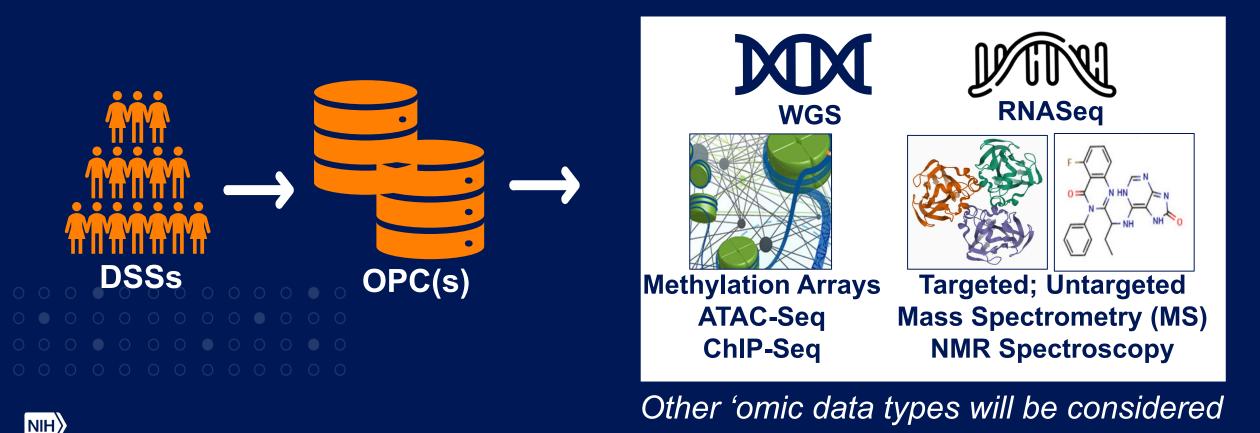

'Omics Production Centers (OPC, 1-2)

Utilize state-of-the-art high-throughput molecular assays

NHGRI

• Minimum of 3 'omic data types, 1 should be non-nucleic acid-based

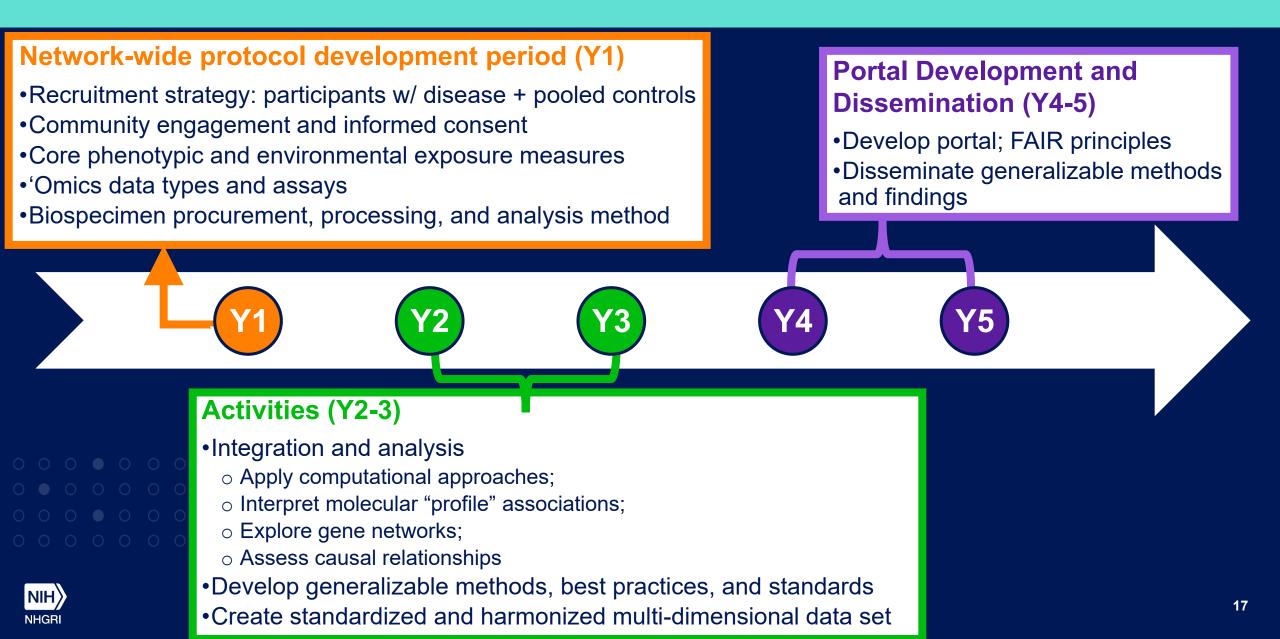

Data Analysis and Coordination Center (DACC, 1)

- Receive, track, and catalog data from DSSs and OPCs
- Coordinate consortium-wide activities including:
 - Consensus on recruitment strategies and the choice of 'omic data types and assays
 - Developing the consortium-wide data analysis process
 - Liaising with the AnVIL to facilitate data sharing
 - Establishing working groups for methods development
 - Producing the standardized multi-dimensional data set
 - Diverse ancestral backgrounds
 - Participants with and without disease
 - Data from all or most 'omes **AND** all time points
 - Key meta-data
 - Developing the visualization portal
 - Rapidly disseminating consortium outputs

Consortium-wide Expertise, Activities, and Timeline

Diversity and the Multi-Omics Consortium

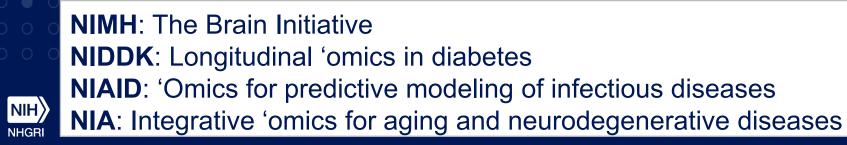

- Overrepresentation of European ancestry in research:
 - Undiscovered genetic variation
 - Inaccurate risk prediction tools
 - Inequity in the distribution of benefits from research
- To increase the diversity of genetic ancestries:
 - Minimum of 75% individuals from underrepresented ancestral backgrounds
 - Establish recruitment, retention, and meaningful community engagement strategies, including outreach to racial and ethnic minority communities
- Promise of Genomics requires a diverse genomic workforce
- To enhance the excellence and inclusivity of the research environment:
 Strongly encouraged to assemble study teams from diverse backgrounds, including individuals from underrepresented groups

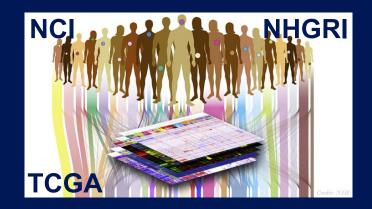

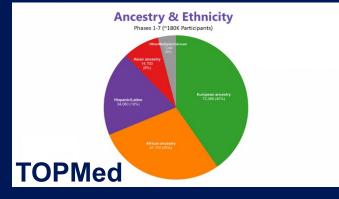

Relationship to Ongoing Activities

- Complements existing NIH investments
- Differs from other initiatives:
 - **Prospective** enrollment and study design
 - Multiple disease areas
 - Collection of specimens at multiple time points
 - Production of major 'omics data types from the same sample
 - Consent for future use and broad data sharing without data use limitations

Proposed Budget

- Approximately \$8M per year
- Duration: 5 Years
- Total for 5 Years: \$40M
- Total number of samples and sites will depend on available funds

A C (

- Preliminary Council Feedback
- Background and Rationale
- Objectives and Scope
- Budget
- Summary

In Summary, NHGRI Proposes...

- Explore the use of multi-omics to detect and assess molecular "profiles"
- Leverage these exploratory association studies to develop generalizable methods, best practices, and standards for the optimal application of multi-omics;
- Create a multi-dimensional dataset that is available and interoperable

The primary goal is to validate and enhance generalizable multi-omic approaches to identify meaningful biological changes related to health or disease.
